Service Station (alts.), Tatnall street, Wilmington, Del., \$6,000. Architect, private plans. Owner, W. F. Carvell, 2325 West Eighteenth street, Wilmington, Del. General alterations. Contract awarded to Domenick Cantero, 1911 West Ninth street, Wilmington, Del.

Store and Residence (alts.), 616 King street, Wilmington, Del., \$6,750. Architect, private plans. Owner, David Levine, care of builder. General alterations. Contract awarded to H. B. Clark, 602 Orange street, Wilmington, Del.

Malia Exhibit at the Philadelphia Building Show, Winner of the Prize Cup.

A PRIZE EXHIBIT

At the recent Philadelphia Building Show, the exhibit of Thomas J. Malia, 226 W. Mentor St., Philadelphia, was awarded the cup for the best practical display. Mr. Malia is a successful and well-known builder of porch enclosures who has been engaged in this business for the past fifteen years. The Malia Exhibit, which attracted much attention, displayed a model living room enclosed in a most attractively designed booth, in the style of a fine home exterior.

Warren-Ehret Company, Philadelphia, have been appointed exclusive agents in this country for "MARTINIT" Asbestos Cement Shingles, manufactured in Holland by The Martinit Company, Ltd.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

(Continued from page 564)

Besides the mortar the bond or method of laying the brick in the wall makes a considerable difference in the strength of the wall as was shown by the tests on piers made at the Watertown Arsenal.

Percentage Gain in Strength by Various Methods of Laying Brick

Method of Laying Brick	Percentage Gain in Strength
BRICKS FLAT:	
Joints broken every course ...	0
Joints broken every 6th course	7.2
BRICKS ON EDGE:	
Joints broken every course ...	43.6
Joints broken every 3rd course	57.1

As far as the real safety for all ordinary construction is concerned, it would seem as important to study the adhesion of the mortar to the bricks and the method of laying the bricks in the wall as to determine the compressive strength of the wall. The old method of stiffening walls was to make them thicker. This method got results but was not very scientific or economical. With the more modern custom of using thin walls, it seems very important to determine just what bond and just what mortar develop the maximum strength.

In connection with absorption, it was mentioned that the percentage of absorption would influence the adhesion between the mortar and the brick. This difference also should be determined.

Tensile Strength: Tests on the strength of a brick are not yet available for publication but it seems very probable that the tensile strength has a bearing not only on the compressive strength but on the modulus of rupture which is more important. This subject would be an interesting one to study because of the numerous kinds of clay and several ways of making brick, all of which might affect the tensile strength. Stiff mud bricks may be end cut or side cut and since the augering operation is the same for all cuts, the "grain" of the brick would be different in each case varying with the clay or shale.

This subject of cutting the brick in manufacture should also be studied to determine the effect of the adhesion of the brick with the mortar and consequently the effect on the strength of the wall.

Size of Building Brick and Tolerances: The Standard Specifications for Building Brick of the A. S. T. M., now state that "The Standard Size of building brick shall be $2\frac{1}{2}$ by $3\frac{3}{4}$ by 8 inches."

This size was determined upon after mature consideration and several revisions and represents not only the standard of this society but also the accepted size of all brick manufacturers associations with the exception of a $\frac{1}{8}$ inch increase in width for smooth face brick.

However, the above figures were accepted by all of these associations, Governmental Departments and others in attendance at a conference in 1923 at the Division of Simplified Practice of the U. S. Department of Commerce with this important addition, namely, that this size was considered as approximate only and represents the standard size to be aimed at by the manufacturer for the average of his entire production. Such a statement, which has been promulgated by the Division of Simplified Practice, should undoubtedly be immediately incorporated in the A. S. T. M. Specification.

In Conclusion: It is, of course, the desire of the American Society for Testing Materials and of all its loyal and hard-working Committeemen, to have its specifications and standards, which represents years of the most exacting laboratory research, many tests and exhaustive study and deliberation, referred to and used wherever and whenever possible.

I trust, therefore, that fullest encouragement and cooperation will be offered to all proper and authoritative agencies in the conducting of tests on new and old brickwork in walls and piers of all types and under all conditions sufficient to reach definite conclusions for specificational requirements covering all grades of individual brick that will insure their approximate and economic use according to structural intent or climatic exposure.

It will be a large undertaking to get the right kind and amount of data necessary, the scope of which is merely indicated in this paper. But it can be done!

COMMITTEE ON "CURBING OF BUILDINGS"

Created by American Institute of Architects

Realizing that differences now exist among architects, contractors, appraisal organizations, bonding companies, and others concerned with the size and approximate cost of buildings as to the methods used in determining the cubical contents of any structure for estimating, appraisal and other proposes, the American Institute of Architects has appointed a committee to ascertain, codify and review the various methods now in use and prepare a report to the Scientific Research Department of the Institute.

This Committee which is known as the "Sub-Committee on Cubing of Buildings" of the Structural Service Committee of the Institute is composed of D. Knickerbacker Boyd, Chairman, Dr. Warren P. Laird, Philadelphia, and Dalton J. Snyder, Detroit.

It is the desire of the committee to receive the co-operation of all Associations, Companies and individual authorities in developing methods of cubing various buildings which may be accepted

by the Building Industry and used by all as common basic factors.

Suggestions or information relating to this subject which will assist the committee and the industry will be welcomed. They should be sent to D. Knickerbacker Boyd, Chairman, 112 South 16th St., Philadelphia, Pa.

FINE GROUND CEMENT MAKES STRONG CONCRETE

New light on how fine-grinding of cement makes concrete stronger is given by a ten year research just completed at the Bureau of Standards, Department of Commerce. Experiments prove that fine-grinding makes concrete stronger, especially if greater amounts of cement are used with the sand and gravel. The same

increase may be obtained as economically through the use of more cement.

The research is part of a larger program of bureau research on useful properties of materials and how they may be enhanced. That fineness is a vital characteristic of Portland cement has long been known, but data were lacking as to the exact effect of such fineness on Portland cement over long periods of time. These data are now available.

Ten years ago test cylinders of concrete were made up of five brands of cement and Potomac river sand and gravel. These were first kept in moist air 28 days, then exposed to Washington weather for periods up to 10 years. Specimens broken after 6 months, 1, 2, 3, 5 and 10 years showed greater strength compared with similar specimens made of normal cement. The older specimens showed less increase but the result is conclusive; fine grinding of the cement increases the strength of the concrete, especially with rich mixes.

As the industry grew, the fineness has increased until at present under the national specification or quality standard 78 per cent. passes through a standard cement sieve having 40,000 openings per square inch.

NEW METHOD FOR MEASURING STRAINS IN CONCRETE STRUCTURES

Some time ago the Bureau of Standards, Department of Commerce, brought out what is known as an "electric telemeter" for measuring changes in the length of structural members produced by variations in the load upon the structure. The operation of the telemeter depends upon the variations in resistance to the passage of an electric current of a stack of carbon disks. This is the same principle as that employed in the microphone in the transmitter (the part we talk into) of the telephone. There is, therefore, nothing new in the principle employed, but the Bureau was the first to apply this principle to a precision measuring instrument.

Recently a new use has been found for this device in the measurement of the strains in mass concrete. For this purpose a special cartridge has been designed which houses the stack of carbon disks, and which is embedded in the concrete at the point where the measurement is to be made. Wire leads extend to the surface and are carried to some convenient point where the indicating instruments are placed. These instruments are calibrated to show any deformation in the concrete due to loading.

The instrument will shortly be used in an investigation which is to be carried out by a special committee sponsored by the Engineering Foundation on a dam to be erected at Fresno, California.

WHAT IS AMPLE TIME TO TAKE OFF QUANTITY AND PREPARE BID?

Recently, the members of the South Carolina Chapter of Associated General Contractors of America arrived at the conclusion that architects were not allowing contractors sufficient time within which to estimate plans and specifications and prepare bids. They were of the opinion that, in fairness to owners and themselves, a sufficient length of time should be allowed for estimating to avoid unfairness to both. A committee was appointed by this Chapter to make a study of the situation and submit its report. Following careful investigation and compilation of data submitted by a large number of members, the committee submitted a report which they believe will give contractors a fair shake.

A reprint appearing in the *California Constructor* with reference to the above, is herewith submitted.

Associated General Contractors
of America
Southern California Chapter
To the Architects of Southern California.

Gentlemen:

We are sure you will respond with your hearty cooperation when a reasonable request is made for standardization of some of the practices in the contracting and building business. Our immediate problem is to obtain building plans in time to properly prepare contractors' bids. We all know instances where both architects and contractors were rushed to put in long hours of night work to complete their work a few days earlier to please the owner, who then delayed the proceedings indefinitely or abandoned the work entirely. "Undue haste makes waste," is an old but true saying.

Some architects have assured us that they consider the accompanying schedule of time required for preparation of bids as being not only reasonable but a minimum for careful work such as we wish them to receive. The following article is taken from the *California Constructor*. We will appreciate your assistance in establishing this better practice.

Yours very truly,
E. EARL GLASS, *Exec. Sec'y.*

CONTRACTORS ATTENTION, PLEASE

Ever since designers first began to put their ideas on paper in the form of plans, there has probably been a wide variance in the time allowed for the contractors to prepare their estimates. The designer holds firmly to the belief that the contractor would put his plans aside until the day before bids are to be taken and then call for more time, even if he got them a month before the opening, while the contractor claims that the architect ponders over his job for months and then

expects the bids the following Monday morning at ten o'clock, while he takes the Saturday afternoon off for golf.

Of course both are wrong but there is a middle ground where we can meet and the A. G. C. Chapter has prepared a schedule of time required for preparing bids, to serve as a guide to all concerned. It is not held that such time can be predicted to the day, but we ask all Southern California Architects to save this list and use it as far as possible in allowing sufficient time for proper preparation of building estimates. We thank you.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Acids Do Not Harm these Concrete Floors—

L. A. Dreyfus Building Rosebank, Staten Island, N. Y. Turner Cons't. Co. Engrs. & Contrs.

They're Protected with "ANTI-HYDRO"

The concrete floors in this building are constantly covered with acids and water which would quickly deteriorate them if they were not hardened and waterproofed with "ANTI-HYDRO." Although these floors have been in constant use for many years, "ANTI-HYDRO" has fully protected them from wear, water and the action of the acids. "ANTI-HYDRO" is a liquid integral agent that mixes easily with the gauging water—no skilled labor is required. It hardens and waterproofs concrete and makes it acid, alkali and oil-resisting all in one operation. For 21 years "ANTI-HYDRO" has been the accepted standard. Results are guaranteed permanent. Use "ANTI-HYDRO."

As The Editor Sees It

DO WE BUILD TO BURN?

By Virgil G. Marani, C. E., M. Am. Soc.
C. E., Chief Engineer The Gypsum
Industries

Of striking interest to the general public is the January, 1925, issue of "Safeguarding America Against Fire," published by The National Board of Fire Underwriters, which lists in detail the amazing and preventable fire loss in the United States during 1923. Commenting on this national waste of materials and labor, under caption "A New World's Title for America," the editorial states:

"World titles are no strangers to Americans. The soil of America seems fallow for their birth and the spirit of America favorable to their nurture. Only—among the concentration here of championships of the 'bests' in this and the 'highest' in that, there are, unfortunately, a few 'worsts,'—'world worsts.' One of these is the national fire loss.

"Nowhere in that part of the universe known to be inhabited is there an amount of burning to be compared to that in America. This is a distinction, of course but it is a wretched one, especially for a country which makes proud boast of progress. Material progress is born of shrewd concern for the future; and what kind of thought for the future can it be that a people takes when it continues year after year literally to burn it up? In the last analysis all destruction by fire, whether it means the affacement of natural resources or of improved property,

constitutes a burning not only of what is, but of what might be, in time to come."

The foregoing quoted matter is certainly food for sober thought especially since the statements, harsh as they may seem, are supported by the tabulations of the Actuarial Bureau of the National Board of Fire Underwriters which, for the year 1923, reports the value of fire consumed property at \$535,372,782, an average of \$1,466,775 daily, or \$1,019 a minute. Also the fire loss in America during 1903 was \$145,302,155. This preventable waste has increased 269 per cent during a period of twenty years in spite of many commendable efforts to raise the standard of building construction through the enactment of laws and ordinances.

Accepting the fact that no substance will burn unless it is set on fire, it is safe to state that in a large majority of instances most of the annual fire waste is due to strictly preventable causes such as defective chimneys and flues, fireworks, etc. gas, open fires, ignition of hot grease and oils, etc., matches and smoking, open lights, petroleum and its products, rubbish and litter, sparks on roofs, steam and hot water pipes, stoves, furnaces and boilers. Of the fire losses reported for 1923, more than \$29,000,000 was wasted, irrevocably lost, through the careless use of matches and smoking, and defective chimneys and flues were responsible for a fire waste loss of more than \$20,000,000.

It is not necessary, for the purpose of this article, to list each of the preventable and partly preventable fire losses, but

with an annual fire loss of considerably more than half a billion dollars, and the consequent tax levy to install and maintain adequate fire departments and fire fighting apparatus, a new world's title for America might be—"We Build to Burn."

Building code legislation throughout the states does not provide sufficient fire protection regulations for the non-fire-proof (combustible) structure. In support of this statement attention is directed to the 1925 report of the National Fire Protection Association's Committee on Building Construction, which is a complete set of specifications for the residence class of buildings. It is safe to state that if the recommendations of this report, which are not impossible or prohibitive, were enforced as a part of the building regulations of every city, the fire loss, for the types of construction covered, would be reduced at least 75 per cent.

Considering types of building construction generally, and the commonly used materials intended to increase the fire resistance, there is no non-metallic mineral substance that is making greater headway, and is more universally recognized as fit for the purposes intended, than gypsum. In the first place this mineral is extremely economical and abundant, being produced in eighteen of the United States, and Alaska, as well as being imported from Nova Scotia, New Brunswick, and Ontario, Canada. At this time the annual consumption of gypsum

for building purposes is more than four million tons. For various purposes and in different forms gypsum structural products are approved by the Underwriters' Laboratories, Inc. In view of the foregoing, and with due consideration of commonly accepted and prevailing types of construction that involve the use of gypsum in all or any one of the forms in which this product is marketed, the following will prove of interest:

(1) *In the Construction of Fireproof Buildings*

The essentials necessary in this type of construction are the use of materials, and combination of such, which will afford the greatest possible degree of fire resistance. Since the average temperature of a fire in a well filled structure has been found to be about 1700 degrees Fah., it will be readily seen that under such a degree of heat it is only a question of time until materials regarded as "fireproof" will be destroyed. In other words, and strictly speaking, there is no material or construction which is actually "fireproof" since high temperatures and time will destroy anything known to man.

The features aimed at in the assembling of materials for the fireproof (so called) building are:

(a) The thorough and complete protection from fire of any steel members used to carry loads.

(b) Floor construction of incombustible materials which will resist a time-temperature fire and water test for four hours. The test to be carried out in accordance with the specifications for such of the American Society for Testing Materials.

(c) Roof construction equal to the fire test requirements for floor construction or, in some cases, constructed of incombustible materials without regard to the degree of fire-resistance.

(d) The fire protection of steel columns and trusses for a period of two, three or four hours time-temperature fire

and water test, depending on the use to which the building is put. The apartment house or hotel would require but a two hour fire test, while the storage warehouse should have the steel supports protected for a period of three or four hours.

(e) According to the use to which the building is put there should be well defined restrictions of floor area between fire walls.

(f) Dividing partitions should be of fire-resistance or incombustible materials. Between separate tenancies they should resist a time-temperature fire and water test for two hours.

(g) The walls of public corridors and similar horizontal exits should be of incombustible materials which will resist a time-temperature fire and water test for a period of two or three hours depending on the occupancy of the building. In the case of a theatre, hospital, asylum, and buildings of like character the fire test should be for the three hour period.

(h) Important vertical openings, such as stairway and elevator shafts, should be enclosed with construction of not less fire-resistive value than required for public corridors and similar horizontal exits.

(i) In the best fire-resistance (fireproof) construction, openings through fire walls, dividing partitions between separate tenancies, and the enclosures to vertical shafts, should be equipped with fire doors capable of resisting the standard fire and water test for a period of not less than one hour.

(j) Wainscoting, framing and trim of all doors and windows, as well as the doors, should be of metal in cases where the greatest possible fire resistance is desired. Wooden floors are often prohibited. Where woodwork is permitted it must be in close contact with the fire-resisting or incombustible material. Concealed air spaces must not be allowed where combustible materials are used.

In the foregoing, which outlines the

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C.—SEALED PROPOSALS will be opened in this office at 3 P. M., Sept. 29, 1925, for the construction, including mechanical equipment and lighting fixtures, and incidental alterations to the present building of a one-story semi-fireproof extension of about 2,380 square feet ground area at the U. S. P. O. & Ct. H., Williamsport, Pa. Drawings and specifications may be obtained from the Custodian of the building or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the erection and completion of a Senior High School Building to be erected on the plot of ground lying at the northwest corner of West College Avenue and South Beaver Street, York, Pa. The proposals must be submitted separately for the—General construction of the building, Plumbing and Drainage, Electrical Work, and Heating and Ventilating—all in accordance with plans, drawings and specifications prepared by John B. Hamme, Registered Architect, York, Pa. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders.

Plans and specifications may be secured from David N. Crider, Secretary of the Board of Directors, in the Central School Building, corner of West King Street and Cherry alley, York, Pa., upon application accompanied by a deposit of cash or certified check of \$100 for each set of the General plans and specifications, \$85 of which will be returned for each set when plans and specifications are returned to said office accompanied with bid. A deposit or certified check for \$50 must accompany applications for each set of the Plumbing and Drainage, Electrical Work, or Heating and Ventilating plans and specifications, \$35 of which will be returned for each set when plans and specifications are returned accompanied with a bid.

In case no bid is received the entire amount of the deposit or check will be forfeited.

On or about September 21, 1925, plans and specifications will be delivered to persons making application in accordance with the above requirements. Plans and specifications will be on view in the office of John B. Hamme, Registered Architect, Citizens' Savings and Trust Building, in the office of M. O. Lewis, Superintendent of Buildings and Grounds, in the Central School Building, York, Pa., and at the Builders' Exchanges in Philadelphia, Pa., and Baltimore, Md.

All bids must be signed, sealed, properly marked with name of contract bid upon and delivered to David N. Crider, Secretary, Central School Building, York, Pa., not later than one o'clock P. M. of Thursday, October 15, 1925.

The right is reserved to reject any and all bids.

EDWARD W. NEUMANN,

Chairman of the Committee on Buildings, Grounds and Fuel, of the Board of School Directors of the School District of the City of York, Pa.

(Continued from Page 580)

high lights in fireproof (so-called) construction, gypsum in any of its many forms will meet the requirements set forth, since the physical characteristics desired of any material from a fire-resistant point of view are:

That it must be incombustible and not support flame.

That it must resist the action of high temperature for a pre-determined period.

That it must be a poor conductor of heat.

That it must have a low—almost immeasurable—total expansion when subjected to fire.

That it must not spall, warp or buckle out of place when attacked by fire and drenched with water.

That it must be of such form and character as to be easily adapted to the purpose intended with due consideration to the equipment and labor necessary to execute the work.

Standard fire, water and strength tests, made by the Underwriters' Laboratories, Inc., and the fire testing station of Columbia University have demonstrated, beyond question of doubt, that for equal thickness gypsum will resist high temperatures for greater periods of time than any other commonly used fire resistive (fireproof) material. The destruction of gypsum from fire is due entirely to a slow calcination process which takes place during the period when the chemically combined (about 20 per cent by weight) water of crystallization is being liberated by heat. The tests referred to have shown that at a temperature of 2200 degrees Fah., it will take four hours to calcine the material to a depth of 3-1/3 inches. Also, at the end of this period (4 hours) the temperature of the gypsum, 3 inches back from the 2200 degree Fah. fire, was only 315 degrees Fah., and 6 inches back it was but 208 degrees Fah., or less than the temperature of boiling water. When we consider the effect of 2200 degrees of heat for four hours, we realize that six inches back from the face of the furnace only 9-1/2 per cent of this temperature had penetrated, we have a complete answer to the superior low conductivity feature of this material.

The calcination of gypsum is a uniform and slow process and is not attended by undue expansion, warping, buckling and similar contributory causes of destruction. This is due to the fact that while calcination is taking place the water of hydration is being liberated in the form of steam, and for this reason the gypsum mass that is exposed to fire cannot attain a temperature that is appreciably higher than that of boiling water.

In fireproof (so called) construction gypsum building products fulfill all the requirements as follows:

(1) Gypsum tile for furring and for non-bearing dividing and corridor partitions.

(2) Gypsum tile for non-bearing stairway and elevator enclosures.

(3) Gypsum tile for fire protection of steel columns, girders, beams and trusses.

(4) Gypsum tile for floor void fillers in reinforced concrete construction.

(5) Gypsum plaster board and gypsum plaster for suspended ceilings and non-bearing incombustible partitions when secured to metal supports.

(6) Gypsum wall board, without plas-

ter, for the finish of walls, partitions and ceilings in the interior of the building, when secured to metal supports.

(7) Reinforced gypsum for poured-in-place floors and roofs.

(8) Reinforced gypsum pre-cast tile or slabs for roofs.

(2) *Slow Burning Factory Construction*

The term "slow burning factory construction" usually applies to what is known as "mill construction," a type of building which represents a splendid risk if in detail the recommended essentials are faithfully carried out. Buildings to be regarded as falling under this classification should conform to about the following general standard requirements:

(a) Masonry exterior walls and foundation.

(b) Masonry enclosing walls for stairway and elevator shafts.

(c) Timber columns for all floors (except top floor) to be of single piece and not less in area than 100 square inches. Top floor columns (supporting roof loads only) to be timber of not less in area than 64 square inches. All columns shall be a single piece.

(d) Floors shall be packed and not less than 4 inches thick, or matched or splined floors and roof decks not less than 2-1/2 inches thick.

(e) Girders or beams supporting packed floors to be timber of not less area than 60 square inches. When supporting matched or splined floors or decks they shall be timber of not less area than 48 square inches. All such timbers of less than 160 square inches shall be a single piece.

(f) Rafters supporting roof loads only shall be a single piece of timber of not less area than 36 square inches.

(g) Concealed air spaces of any character are not allowed. Any fire protection material must be applied so as to follow the contour of the construction and be in contact with the surface protected.

A construction closely following the foregoing general requirements will usually afford better salvage values after the average fire than any other type of fireproof building, and this for the simple reason that heavy timbers will char rather than flame and there is no destruction from expansion, contraction, warping and buckling since wood is a poor conductor of heat.

It is hardly necessary to state that in a building of this character, gypsum products used for the fireproof structure can be used to equal advantage in this case. The most common application of gypsum in buildings of "mill construction" is for:

(1) Gypsum tile for furring and for non-bearing stairway and elevator enclosures.

(2) Gypsum plaster board and gypsum plaster for non-bearing incombusti-

ble partitions when secured to metal supports.

(3) Gypsum wall board, without plaster, for the finish of walls, partitions and ceilings in the interior of the building.

(4) Reinforced gypsum pre-cast tile or slabs for the roof.

(3) *Ordinary Construction Buildings*

Since this type of construction involves exterior walls of masonry and interior floors, partitions and the roof of wood frame it is unreasonable to require for buildings of this character a degree of fire protection without due consideration of the fire hazard which exists in the construction by reason of the combustible nature of the interior. The best that can be done to reduce the conflagration loss possible is to require certain refinements in methods of construction which, taken collectively, will retard the progress of fire for a sufficient period to assure the occupants a safe exit. From usual interior fire hazards an appreciable degree of fire protection can be obtained by:

(a) Firestopping the hollow partitions for 18 inches at the floor and ceiling levels.

(b) Intermediate firestopping at joists between ceiling and floor.

(c) Firestopping between joists and rafters at wall bearings and at furring on exterior masonry walls.

(d) Plastering all ceilings, including those of the basement and attic, upon incombustible lath.

(e) By interposing a layer of incombustible material between the rough and finish floors and between the roof boards and wood shingles or other combustible wood covering.

Gypsum products are particularly adaptable to the foregoing simple requirements. They are successfully used in the following:

(1) For all firestopping purposes by being poured in place in a plastic state or by cutting (sawing) gypsum tile or gypsum plaster board to fit and nailing in place.

(2) Gypsum plaster board 3/8 in. or 1/4 in. thick is used between floors or over the roof boards and under wood shingles.

(3) Gypsum plaster wherever used, and especially upon incombustible lath such as gypsum plaster board, affords a degree of fire protection not possible with any other known plaster and lath.

(4) *Wood Frame Construction Buildings*

This type of construction is particularly dangerous when considering fire from exterior or interior sources. The greatest loss, due to the nation's annual fire waste of more than \$500,000,000 is carried by wood frame construction. As in the case of buildings of ordinary construction, the progress of fire can be materially retarded by efficient firestopping of all hollow wall spaces including, in this case, the exterior walls.

While firestopping is the most important item to consider in ordinary and wood frame buildings, no really scientific thought has been given toward methods and materials, used for this purpose, which can be easily applied at a minimum cost and which would assure the desired results. Blocking of incombustible material is being used, but improper fitting, poor nailing and the shrinkage of the wood construction results in leakage which reduces the efficiency of the firestop. Metal lath baskets fitted in place and filled with loose incombustible material are better in theory, but the cost discourages faithful compliance.

A recently developed gypsum product, in the nature of porous or puffed gypsum, has done wonders toward making the firestopping and insulation of buildings a simple and economical matter as well as a practical success. This material is shipped to the job in 80 pound paper bags, is mixed with water and poured in place. According to the purpose intended this product is shipped so that after mixing, the material in place will weigh from 12 pounds to 30 pounds per cubic foot, the lighter substance being used solely for insulation, and for fire protection purposes when held in place by the construction. The 24 pound material is used for floor and roof fill while the 30 pound lends itself to making of structural units such as tile, etc.

The principle involved in the manufacture of porous or puffed gypsum is the introduction, in varying proportions, of chemicals into the calcined gypsum powder. When stirred into water the mixture becomes active, and a chemical reaction takes place releasing carbon dioxide gas and leaving a gypsum mass which sets hard in place and contains millions of minute air cells. The weight per cubic foot of the set and hard material depends on the quantity of dry chemical originally introduced into the gypsum prior to shipment.

The commercially valuable feature lies in the fact that the chemical action which causes the formation of air cells also increases by many times the original bulk with resultant corresponding reduction in weight per cubic foot. The incombustible and fire resisting properties of the predominating cementitious material (gypsum) are not impaired but rather are improved owing to the increase of non-conducting individual air cells. This feature will also improve the acoustic properties. This product is used in fireproof and other building construction for the following purposes:

(1) Poured-in-place or in the form of pre-cast units for non-bearing furring, partitions, shaft enclosures and for the fire protection of metal supports.

(2) Poured-in-place on top of reinforced concrete and clay tile roofs and

floors for insulation and sound deadening.

(3) Poured-in-place or in the form of pre-cast units for insulating exterior walls of masonry.

(4) Poured-in-place or in the form of pre-cast units to fill the hollow space between wood stud supports for fire protection and insulation.

(5) Poured-in-place to fill to desired thickness, space between wood ceiling joists and rafters for fire protection, insulation and sound deadening.

(6) Poured-in-place fill of any character for firestopping and for any purpose where increased fire protection and insulation is desired.

There are other valuable uses of gypsum building products but the substance of this article is sufficient to illustrate the elastic possibilities of gypsum and the adaptability of this valuable, economical and easily procured mineral to present accepted methods and types of construction.

PRACTICAL POINTS IN HOME BUILDING

BY BETTY BARRETT

The modern trend in home planning is away from a strict conformity to any particular architectural style, for comfort and convenience are not sacrificed in the cause. Often the type of architecture selected does not, in its pure form, allow the inclusion of some rooms which the family would enjoy.

Our thoughts are turning more and more toward making the home a really pleasant place in which to live, and we are finding that beauty and comfort may more often be combined by taking some architectural style for an inspiration in building the home than by slavishly following that style in its every detail, regardless of the particular needs of the family building the home. The success of the home of today may be measured by its adaptability to the requirements of the family occupying it.

For example, in the matter of the number of rooms in a home and their use, it seems to be too prevalent a practice to build so compactly that there is no allowance for any room other than that which is absolutely necessary to carry on the routine of living. The very small house is not the only offender in this respect, for larger homes often have the same fault.

The old fashioned den, with its big open fireplace seems to be unknown to many who build homes today. And where is the sunny breakfast room which makes a morning meal cheery? Breakfast nooks are a boon, and are often delightful, but where there is any opportunity at all, do let us have a real breakfast room that we may breakfast and lunch in away from the kitchen with its

sometimes unavoidable heat, yet spared the bother of setting the dining room table. Build a large window in the breakfast room that will give an inspiring view of the out of doors.

But about the den. In the first place, the den may open off of the living room and make a gathering place for those of the family who would read and write in quiet away from the buzz of conversation in the living room. A cozy den will often prove a lure to the youngsters to make their studying a pleasure instead of a task.

The walls of the den may have book cases built in, and it is the one place in the house where the exhibition of family photos is not in poor taste. The mantel over the fireplace is just the place for bric a brac which would be out of place

elsewhere because of its personal nature. The den may serve a strictly utilitarian purpose, if necessary, for either a wall bed or one of the new type of concealed closet beds may be installed in the closet, ready for the use of a chance guest. One very charming home had a lavatory built just off of the den, which makes it a completely equipped guest room, and, at the same time, served the family every day in the year. If there is not room for a closet to conceal a bed, build the lavatory and put a davenport bed in the room itself. Really, the delights of the den more than compensate for the outlay of money used in building it.

Another delightful adjunct to the modern home is a sun porch, either glassed or screened in. If it is glassed in, the furnishings may be of the daintier type and bright colors used to make a pleasant room for older folks who spend so much of their time indoors. If the porch is screened in, the bright colors may still be used, but the rugs and furniture should be sturdy enough to stand damp weather. Some sun porches are built with one wall as a series of French doors which may be opened to give an almost complete exposure onto lawn or patio.

Speaking of porches, let us not forget the sleeping porch. We enjoy the weather during the day—why deprive ourselves of the fresh air at night? Of course, a cross ventilated bedroom is light and airy, but it doesn't have the out of doors feeling that a real sleeping porch does.

The sleeping porch may be screened to within four feet of the floor if it is located on the side of the house away from the street. Ventilating shades can be installed on the sleeping porch which may be lowered on sunny afternoons to make a cool quiet spot for a restful nap.

Every kitchen should have plenty of cupboards and drawers, a cooler, and a counter where the housewife may set things in passing. Floor space for at least one table should be allowed, and, if desired, the stove may be placed in a hooded alcove. The disappearing ironing board is another adjunct of the modern kitchen which should not be sacrificed.

All these points which I have mentioned are applicable to the building of the moderate priced house.

—Keith's Magazine.

WATER CONTENT OF CONCRETE VITAL

One can no more get good concrete by mixing cement, sand, rock and water indiscriminately than one can get good bread by mixing flour, water and yeast without attention to the proportions or the manipulation.

While this fact is generally recognized

by experienced concrete users, there is still much misunderstanding as to the accuracy of mix required. Particularly is this true with regard to water. Many persons imagine the amount of water in the mixture is unimportant—that any concrete which is really wet will harden properly.

Hardening is Not Drying

Nothing could be less accurate. The hardening of concrete is a chemical process, and for the best results the proportions of materials must be gauged as accurately as for a cooking recipe. Concrete does not harden by drying out; it hardens by the chemical combination of the water with the cement in it. Too much water prevents the cement from hardening properly, just as it prevents glue or paste from sticking effectively, yet a certain amount is absolutely essential. The rule on ordinary work is to use as little as will give a workable mixture. Concrete that has to be shoveled will harden much stronger than concrete that can be poured.

Carefully performed experiments have proved that concrete made with too much water will have only a part of the strength it might otherwise have attained. Mix one bag of cement with sand and rock, and put in even a pint more water than is necessary, and you will weaken the finished concrete as greatly as though you had left out two pounds of cement. After the concrete has solidified, however, it should be kept moist for ten days or so by sprinkling water over it. This aids it greatly in "curing" and the amount of water, so it is sufficient to keep it moist, is unimportant.

Use Smallest Possible Amount

The proper amount of water to use in any concrete mixture is the smallest quantity that will give a mix sufficiently plastic for the work in hand.

Concrete must be mixed thoroughly, and plenty of time should be taken to insure that this feature is not slighted. Under no circumstances should the time of mixing be less than one minute after the ingredients are all in the mixer. The speed or energy with which concrete is mixed does not count so much as the time allowed for the materials to be thoroughly blended.

The sand and stone should be graded carefully, and above all should be free from organic material. Strong concrete cannot be made from dusty or dirty sand and stone. Gravel should be washed and screened into sand and pebbles.

MISTAKES IN USING CONCRETE

The extreme ease with which cement may be obtained and mixed with stone and sand to form concrete, as well as

the economy and permanence of the resulting material, has led to its use for building and ornamental purposes by many persons who are trained neither from the standpoint of structural design nor architectural beauty.

It must be remembered that concrete is a building material. It has many advantages over other material of the same class. But if not used properly it cannot be expected of itself to give first class results.

Here's Why Failures Occur

Without going into a technical discussion of the subject, it may be said that concrete structures of any kind which are (1) not reinforced properly to carry the stresses they must bear, (2) not made with concrete mixed in the right proportions, (3) not permitted to harden sufficiently before being put to use, (4) not protected from cold, if erected in cold weather (5) not actually constructed by the contractor in accordance with the correct plans of the architect or engineer, will not prove satisfactory.

A self-educated builder may know how to mix concrete properly without being in any way qualified to design a concrete building, culvert or retaining wall. And many failures have been traced to the fact that the structure which failed was planned and erected by someone who might have been a good foreman for a qualified contractor, but who had not the technical ability to assume all responsibility for the work which ended so unfortunately.

To blame concrete for failure in such cases would be most unjust. The fault lies with the treatment of it, and not with the material itself.

Utmost Beauty Possible

From the standpoint of beauty, concrete lends itself to the utmost degree of architectural expression. But in the hands of a person lacking good taste it is capable of as great offenses against the artistic as any other building material.

The fact is that concrete has a technique of design, construction and expression all its own. This is easy to acquire, but many people who are familiar with other building materials attempt to employ concrete with the same methods they would use for these other materials. And results are not satisfactory.

Used by people who will take the slight trouble to learn the correct methods, concrete will give better results at less ultimate cost than other materials. Properly designed concrete structures or concrete products will compare in every way with the appearance of similar structures or products of other materials. And the advantages in such matters as durability, service and economy are manifold.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Every Morning You Get the "Leads" that Lead to Business

THE man who has a prospect list of concerns in the market for what he sells certainly has a distinct advantage over the man who must dig around for his leads.

You can have this advantage by subscribing to the

Daily Building News

a daily, authoritative compilation of advance construction news, contracts awarded and other vital information together with names, addresses of interested parties.

It's a service that repays you many times its cost.

Give us a ring today and we will explain fully and tell you how little this service costs.

Hot Water Question Solved By This Little Tank Heater

1. It is but 18 inches high and burns less than a bucket of pea coal or buckwheat coal a day.
2. Only 5 cents a day operating cost in the average household.
3. One-quarter the expense of gas devices to operate. (This is unprejudiced—we make and sell both kinds.)
4. It keeps a FORTY-GALLON tank constantly full of piping hot water. Plenty for bathroom, laundry and kitchen.
5. It needs but a moment's attention night and morning.
6. Quickly installed by any plumbing or heating contractor.
7. People who want to do away with their coal range and use a gas range, can heat their kitchen with a Novelty Tank Heater (larger size) installed in the cellar and in addition have all the hot water they can use.

In these days of many baths every household needs PLENTY of hot water—a FORTY GALLON tankful all the time, such as the Novelty Tank Heater supplies.

Install the Novelty in your houses. Get all the facts—now! Write or phone today for further information. Address Dept. BG-9.

Proposal

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the erection and completion of a Senior High School Building to be erected on the plot of ground lying at the northwest corner of West College Avenue and South Beaver Street, York, Pa. The proposals must be submitted separately for the—General construction of the building, Plumbing and Drainage, Electrical Work, and Heating and Ventilating—all in accordance with plans, drawings and specifications prepared by John B. Hamme, Registered Architect, York, Pa. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders.

Plans and specifications may be secured from David N. Crider, Secretary of the Board of Directors, in the Central School Building, corner of West King Street and Cherry alley, York, Pa., upon application accompanied by a deposit of cash or certified check of \$100 for each set of the General plans and specifications, \$85 of which will be returned for each set when plans and specifications are returned to said office accompanied with bid. A deposit or certified check for \$50 must accompany applications for each set of the Plumbing and Drainage, Electrical Work, or Heating and Ventilating plans and specifications, \$35 of which will be returned for each set when plans and specifications are returned accompanied with a bid.

In case no bid is received the entire amount of the deposit or check will be forfeited.

On or about September 21, 1925, plans and specifications will be delivered to persons making application in accordance with the above requirements. Plans and specifications will be on view in the office of John B. Hamme, Registered Architect, Citizens' Savings and Trust Building; in the office of M. O. Lewis, Superintendent of Buildings and Grounds, in the Central School Building, York, Pa., and at the Builders' Exchanges in Philadelphia, Pa., and Baltimore, Md.

All bids must be signed, sealed, properly marked with name of contract bid upon and delivered to David N. Crider, Secretary, Central School Building, York, Pa., not later than one o'clock P. M. of Thursday, October 15, 1925.

The right is reserved to reject any and all bids.

EDWARD W. NEUMANN,

Chairman of the Committee on Buildings, Grounds and Fuel, of the Board of School Directors of the School District of the City of York, Pa.

Fire Prevention Week this year will begin on Sunday, October 4th, and continue through Saturday, October 10th.

Last year America burned up \$548,-

800,000 in improved property of all kinds. Thus, for the fourth consecutive year the fire losses of the nation have exceeded the half-billion mark, each year rising above the preceding twelve-month by several millions of dollars. Here, surely, is warrant enough for returning anew to the great American peace-time battle—the endless conflict with the flames.

Realization of how monstrous, both in size and in effect, is this rapidly leaping loss, coupled with the knowledge that the annual sacrifice of life, through fire, hovers still around 15,000, seems to be more than ever general and to be spurring to early action the various organizations which habitually take part in furthering the aims of the Week. Judging by the reports reaching the office of The National Board of Fire Underwriters it is probable that no previous observance has been signalized by such timely planning in so many important quarters. It appears that no channel leading to the public ear and eye, and through them to the public consciousness, is being overlooked this year in the endeavor to make one hundred and ten million people think and talk of fire, its prevention and extinguishment, and not only for seven days but for fifty-two times seven days.

President Coolidge, it is expected, will officially nationalize the Week, following his action of the past two years and that of Presidents Wilson and Harding, by issuing a proclamation; and it is next to certain that supplementary messages to the public again will be forthcoming from the governors of a majority of the States. Mayors of many important cities last year responded with local manifestoes, which further tended to impress people with the importance of the occasion.

It is understood that the Chamber of Commerce of the United States is already well advanced in preparations for the fullest possible co-operation next October. Too much importance cannot be attached to the support of the National Chamber. Backed by its 1,400 local units, it constitutes an invaluable ally in the gigantic labor of changing a nation's habits in dealing with fire. The Inter-Chamber Fire Waste Contest, inaugurated by the parent body, and now in its third year, has been of incalculable benefit in the work of arousing and maintaining the interest of thousands of American business men in year-round fire prevention endeavor of a most practical nature.

The United States Department of Agriculture, the United States Bureau of Education and the American Red Cross always have aided materially in their special fields, as have also the National Association of Insurance Agents, the National Association of Credit Men, the Fire Marshals' Association of North

America, the International Association of Fire Engineers and the national organizations of the Boy and Girl Scouts. Rotary, Kiwanis and Lions Clubs everywhere habitually give liberally of time and money towards municipal observances. Indications point to similar promotion during the Week that lies ahead.

The Motion Picture Producers and Distributors of America, Incorporated, through its president, Will H. Hays and his assistant, Hickman Price, for the past two years has lent hearty assistance in "putting over" the Week via the "silver sheet," and the Radio Corporation of America, as well as other factors in this "Fifth Estate," did its part to make the airways available for the driving home of vitally needed lessons in conservation of American life and property. These organizations probably will enlist again this year. The Nat'l Fire Protection Assoc. stands, of course, squarely with the National Board in bending every effort towards giving permanence to the work.

With these representative and widely diversified interests severally pledged to the cause, fire chiefs, local agents, and other individual fire preventionists will find the way smoothed as never before for their own "missionary" work. Upon them, of course, falls the brunt of the campaign, which, as a group, they have shown themselves eager and competent to bear.

MAKING STRONGER CONCRETE

Water is an important ingredient in concrete. Experiments just completed at the Bureau of Standards, Department of Commerce, show that this is just as true with the new quick-hardening high-alumina cements as with Portland cement.

The bureau finds it important to select sand and gravel in proper size gradation since less water is required to make the concrete workable and a greater strength results. The old rule, to use the least amount of water which will make the concrete workable, is found to hold with the new high alumina cement. In one experiment a decrease of 1 per cent of water was found to increase the strength as much as 26 per cent.

The research is part of the program of the materials laboratories of the bureau upon the useful properties of materials and how they may be enhanced.

A gravel concrete made with the new quick-hardening high-alumina cement generally develops as high a strength in 24 hours as a similarly proportioned Portland cement concrete would develop in 28 days. This quick-hardening feature is notably valuable where ground rentals are high, equipment elaborate, or construction difficult, or wherever delays in waiting for the concrete to attain its strength would be costly.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

"ANTI-HYDRO" Keeps Elevator Pits Absolutely Dry

The concrete elevator pits in this building are permanently waterproofed with "ANTI-HYDRO". They are absolutely dry at all times.

No matter how large or how deep you build concrete pits, you can rely on "ANTI-HYDRO" to keep them dry. It waterproofs concrete against any head of water.

ANTI-HYDRO is a liquid integral agent that mixes easily with the gauging water. Any unskilled workman can do it. It both hardens and waterproofs concrete in ONE OPERATION.

During the past 21 years, "ANTI-HYDRO" installations have circled the globe. Carefully kept records fail to indicate one unsatisfactory installation. Use "ANTI-HYDRO" on your next job.

As The Editor Sees It

WOODS THAT GO INTO THE HOME

Only thirty years ago few people knew what went into their houses. All materials were alike to them and the measure of their confidence in the outcome of their building was the measure of their confidence in the architect or the builder who served them.

Within recent years this blind confidence has given place to a general familiarity with a great many building materials so that the prospective builder is enabled to weigh the merits and advantages of the different woods and other materials.

Building for permanency means a wise selection of building materials and using high grade, standard construction. This is the big lesson that the Santa Barbara quake taught. The buildings that suffered the most were of the character where cheapness had been put above permanency by their builders.

"The materials that enter into the construction of a house determine whether that house will be a good house or a poor house; conversely, it follows that a house is no better than the poorest material which enters into its construction—it is always wiser to retain the best of materials in a smaller or a more modest house. Only too often a misguided builder will figure on an ambitious plan and then, to make the building costs come within the scope of his pocketbook, will

employ poor workmanship and use poor materials.

"Lumber is the most widely used building material. There is a mistaken idea abroad that lumber figures mainly in a frame house, not in a brick, hollow tile, stone or cement-block house. Nothing could be more erroneous, for it is a fact that lumber is the main material entering into the construction of any type of house short of a fire-proof office building, garage or theater where steel framework and concrete floors replace the usual wooden construction. Even in the brick, stone or hollow tile house lumber is commonly used for the inside framing and the millwork."

The reason that wood is so largely used is because of its qualities of strength and hardness, lightness in weight and workability.

Woods are divided into two great classes—the hardwoods and the softwoods. "The hardwoods start with the oaks, which are commonly divided into two groups in the lumber trade—the white oak group and the red oak group. Where resistance to decay without preservative treatment is essential, the white oaks are more desirable, because they have greater durability than the red oaks; but where strength and beauty of figure only are concerned, the red oaks are equally serviceable.

"The red oaks usually have a slight reddish hue, and the large pores in the springwood are more open, making the

wood appear more porous, but exceptions occur in which this does not hold true."

Ash is another ring-porous wood. The color of the heartwood is grayish brown, the black ash being darker than the white ash.

Chestnut resembles ash superficially. It has a similar color, is decidedly ring-porous, and has inconspicuous rays.

Elm is used comparatively little in the building trades, for it is liable to become rough from wear in the course of time. The wood is light reddish brown in color.

Black walnut can usually be recognized by its chocolate-brown color. Butternut, like black walnut, is diffuse-porous with plainly visible pores. It is lighter colored than the walnut and softer and weaker.

Mahogany has a reddish-brown color, varying greatly in the unstained wood from light to dark shades. The color gradually becomes darker by exposure to the air and light. The pores are visible without magnification which distinguishes it from cherry, which is of approximately the same color, and from red gum stained to imitate it. Birch is sometimes so effectively stained that it is difficult to distinguish it from real mahogany, but if a small cut is made, the wood will show a white interior, while mahogany is dark throughout.

Birch lumber is derived mostly from two botanical species—the yellow birch and the sweet or cherry birch, which are

very much alike. It is sold as "red" birch and "white or yellow" birch, the heartwood of both species being the "red" birch and the sapwood the "white or yellow" birch. The heartwood is light to moderately dark reddish brown in color, and the sapwood is almost white. Birch wood has a uniform texture, the pores are barely visible with the unaided eye in good light, thus distinguishing birch from maple, in which the pores are much smaller.

Maple is classed as "hard" and "soft." Hard maple is obtained from sugar maple and the latter from silver maple and red maple. A test for distinguishing the two groups is cutting the wood across the grain. The hard maple offers considerable resistance, while the soft maple cuts rather easily.

Beech is occasionally used as flooring but more often in furniture. It resembles maple somewhat, but a portion of the rays are considerably broader and more conspicuous.

Cherry can usually be identified by its lustrous reddish brown color.

The white pines have a soft, slightly resinous wood of uniform texture. This group includes the white pine of the northeastern and Lake States, the western or Idaho white pine and the sugar pine of California.

The yellow or hard pines as a class are harder and more resinous than the white pines, but show great variation in these properties.

Red spruce, Oregon fir, and Oregon pine, can usually be distinguished by its distinct reddish hue, although the outer parts of old trees are often yellowish. It is resinous, but not so much so as the hard pines.

The spruces are important lumber trees, producing light-colored wood of soft, uniform texture.

Cypress varies greatly in color and weight. It is without characteristic taste, but has a peculiar odor which is easy to

remember if a person becomes familiar with it.

White cedar is pale brown in color, very soft and light. It has a characteristic cedar odor that is very noticeable.

The true firs, of which there are several species commonly known as balsam fir, white fir, noble fir and red fir, rather light, non-resinous woods. Douglas fir, white not a true fir, has a similar character.

The following list indicates the relative durability of the common woods and should be an aid to the builder in selecting the more durable species for posts, sills and other structures subject to decay.

Relative durability of common woods

Cedar, northern white	Chestnut
Cedar, western red	Walnut, black
Cypress	Locust, black
Redwood	Cherry, black
Fir, Douglas	Oaks, white
Tamarack	Ash, white
Larch, western	Butternut
Pine, longleaf	Gum, red
Pine, eastern white	Poplar, yellow
Pine, sugar	Oaks, red
Pine, western white	Basswood
Pine, western yellow	Beech
Hemlock, eastern	Birch
Hemlock, western	Buckeye
Pine, loblolly	Cottonwood
Pine, Norway	Elm, white
Pine, shortleaf	Maple, hard
Firs, true	Maple, soft
Spruces	Sycamore
	Cotton gum

The woods used for framework in building are those kinds which are fairly abundant and reasonably strong. The softwoods usually fulfill these requirements, the stronger and more durable kinds being most desirable. In the Central States hardwoods are often used for the framework of buildings.

Manufacturing Building, 5th Ave. Borough of Queens, New York. Architect, The Ballinger Co., 12th and Chestnut streets, Philada. Owner, VieBar Realty Co., Care Architect. Reinf. concrete, brick, stone trim and coping, 2 stories and basement, and part basement. 100 feet x 118 feet, cement floors, steam heat, rolled steel sash, hollow metal skylights, (plumbing, heating, electric and tuao. sprinkler system separate), vaults, ventilators, dampproofing, insulation, toilet, and locker rooms, ash hoists, 30-in. square brick chimney, 75-ft. high boiler room and cold storage in basement, 20,000 gal. steel tank. Contract awarded J. Woodruff & Son, L. Bridge Plaza, New York. Plumbing, Moran Engr. Co., New York City. Heating and electric, Rice and O'Donovan, 253 W. 28th street, New York City. Sprinkler, J. L. Murphy, 238 W. 108th street, New York City.

Proposal

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the erection and completion of a Senior High School Building to be erected on the plot of ground lying at the northwest corner of West College Avenue and South Beaver Street, York, Pa. The proposals must be submitted separately for the—General construction of the building. Plumbing and Drainage, Electrical Work, and Heating and Ventilating—all in accordance with plans, drawings and specifications prepared by John B. Hamme, Registered Architect, York, Pa. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders.

Plans and specifications may be secured from David N. Crider, Secretary of the Board of Directors, in the Central School Building, corner of West King Street and Cherry alley, York, Pa., upon application accompanied by a deposit of cash or certified check of \$100 for each set of the General plans and specifications, \$85 of which will be returned for each set when plans and specifications are returned to said office accompanied with bid. A deposit or certified check for \$50 must accompany applications for each set of the Plumbing and Drainage, Electrical Work, or Heating and Ventilating plans and specifications, \$35 of which will be returned for each set when plans and specifications are returned accompanied with a bid.

In case no bid is received the entire

amount of the deposit or check will be forfeited.

On or about September 21, 1925, plans and specifications will be delivered to persons making application in accordance with the above requirements. Plans and specifications will be on view in the office of John B. Hamme, Registered Architect, Citizens' Savings and Trust Building; in the office of M. O. Lewis, Superintendent of Buildings and Grounds, in the Central School Building, York, Pa., and at the Builders' Exchanges in Philadelphia, Pa., and Baltimore, Md.

All bids must be signed, sealed, properly marked with name of contract bid upon and delivered to David N. Crider, Secretary, Central School Building, York, Pa., not later than one o'clock P. M. of Thursday, October 15, 1925.

The right is reserved to reject any and all bids.

EDWARD W. NEUMANN,
Chairman of the Committee on Buildings, Grounds and Fuel, of the Board of School Directors of the School District of the City of York, Pa.

(Continued from Page 612)

If the sills are in contact with the ground, or the posts are in a damp cellar, or if any part of the frame for other reasons is liable to remain damp, only woods with great natural durability should be selected.

The cheaper and more abundant softwoods are usually selected for the sheathing, roof boards and subfloors.

Shingles demand a very durable wood because they are often exposed to the weather without paint covering or preservative treatment. The cedars, cypress and redwood shingles give excellent results although pine shingles have been known to last many years.

Laths are often cut from slabs and other waste material from many kinds of wood. The chief requirements of laths are softness and freedom from warping.

Lumber used for the siding and exterior trim should be free from warping and checking and should allow nailing with little splitting.

The chief qualities required of flooring are hardness, even wearing, and freedom from slivers.

When oak is used the choice is not so dependent on wearing qualities as it is upon the decorative effect produced. Maple has a compact structure, absorbing liquids slowly which, together with its hardness and pleasing grain, makes it admirably suited for floors. Yellow-pine and Douglas-fir flooring is divided into two classes, namely, "flat-grain" and "edge grain." "Edge grain" flooring is much more desirable because it wears more evenly and is not as apt to sliver. Furthermore, the "edge grain" flooring being quarter sawn will not shrink and swell as much as the "flat grain."

There are many woods that can be used for door and window frames, although a

moderate amount of durability is desirable, for moisture from the outside may find its way into the hidden parts of the frame and produce conditions favorable to decay. Woods that are liable to warp should not be used. White pine is excellent for this purpose.—*Keith's Magazine*.

FALL BUILDING

A continuance of a very active building market seems assured throughout the fall and running into the winter. The year of 1925 will probably come close to a record year for building activities since the war, and an analysis of permits shows a most gratifying share of this building to be homes.

Fall building always has a fever to it, for everyone is trying to complete their building before cold weather and winter storms set in. People living in rented apartments and houses who are building, are consumed with the desire to hurry completion and get released from the landlord. Income producing buildings must be finished in order to secure the new fall tenant. The completion of the fall building program therefore results in everyone being busy. The material merchant is rushed, the contractor has his hands full and the mechanics are all happy because they are busy and making money. It's a time of year full of special interest in the building industry.

How about those of you who are just arriving at the decision to build? Shall we start in the fall or wait over? Start in the fall to the extent of at least putting in your foundation. There may be an open winter so that those of you who are living where the winters are cold will find an unexpected opportunity to go forward with the superstructure in the winter months. If, however, a hard winter prevails, you are that much ahead by having your foundation walls in and seasoned before the erection of the house. If the soil of your building site is soft and sandy it is an excellent idea to give the foundation walls time to settle. By the way, care in securing a good foundation, good supports and footings is important, for any settling must necessarily affect the superstructure by cracking of plaster walls and the opening of cracks in door and window casings. This advice to build this fall is not sectional but general because money seems more available and prices are fairly normal.

We are all delighted with this situation, for there is no accomplishment giving greater satisfaction than building a new house. Everybody, it seems, is doing it and authorities on statistical information like Straus, say in their latest survey that 1925 would be another record-breaking building construction year, accompanied by a condition of general nation-wide prosperity. The prosperity

prevailing in the building industry today undoubtedly will continue indefinitely and there is every indication that a new record of \$6,000,000,000 will be established this year.—*Keith's Magazine*.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men

conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

The BUILDERS' GUIDE is in its fortieth year of continuous publication.

The seasonal decline in construction following the summer months promises to be several weeks late this year, according to statistics compiled by the Associated General Contractors of America. After three months, during which all records for building activity were shattered, these figures show no decline in August from the high mark reached in July. Furthermore, the vast number of contracts awarded in July indicates a large amount of construction is yet to be undertaken before the winter months.

The total volume of construction performed in August during the first eight months of 1925 exceeded that of the corresponding period in 1924 by more than six per cent. This fact also is being mustered to indicate the postponement of the seasonal decline this year.

Despite the enormous amount of building under way, the average of construc-

tion costs in the principal construction centers of the United States was lower in August than at any time during the past twenty-eight months, the index figure, based on 1913, showing a drop of three points to 198. During the past two years, fluctuations of this average cost figure have remained within five points, the limits being 200 and 205. Though the August decline is an encouraging sign with respect to costs, it cannot yet be considered as definitely indicating the advent of the long anticipated downward trend.

The volume of contracts awarded during July, while five per cent. less than the total for June, was greater than the figure for any previous July on record. The total volume of contracts awarded during the first seven months of 1925 exceed the volume for the same period in 1924 by eight per cent.

The number of building permits issued in July was six per cent. greater than the June total and sixty-two per cent. greater than the number issued in July, 1924. The figure for the comparative seven-month period shows an increase of eight per cent. over 1924.

The average of wages in the principal construction centers remained the same in August as in July. Prices paid by contractors for construction materials decreased in some cities, the average of prices dropping five points to index number 179, based on 1913.

Awards for concrete surface pavement totalled 12,000,000 square yards in July, with the figure for the first seven months of 1925 exceeding the corresponding total for 1924 by twenty per cent. Awards for pavement of streets and alleys reached the highest mark on record in July.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

"Take a bath before supper, Dear ---there's oceans of Hot Water"

On warm, sticky, evenings, a refreshing tub or shower makes a new individual of any tired business man. And it has the same effect upon fretful children before Dad's arrival. Fortunate is the family with a BIG supply of hot water—a FORTY GALLON tankful always on tap from the

The Tank Heater
will give plenty of
hot water all the
time.

NOVELTY TANK HEATER

Dad doesn't have to go without a bath because the children have had theirs. The cook doesn't have to worry about hot water for her dishes. The laundress doesn't have to wait for hot water for her clothes. The tank heater keeps right on the job heating more water as fast as it is used.

And does it at but 5 cents a day—burning less than a bucket of pea coal or buckwheat coal each 24 hours. It needs but a minute's attention night and morning and costs but one-fourth as much as gas to operate. (This is unprejudiced for we make both kinds.)

Install the Novelty with its brick-lined fire-pot, baffled water-way, two-bar rocking grate, and reinforcement rods at the sides. We were the originators of this type of coal tank heater. Look for the name on the door. The average family needs a 40-GALLON hot water supply always ready and the Novelty is designed for it. Larger sizes in the Novelty for a still bigger supply where needed.

Get all the facts—now! Write or phone today for further information. Address Dept. BG-10.

New Jersey Construction News

Camp, Brown's Mill, N. J. Architect, J. Fletcher Street, 1120 Locust street, Philadelphia. Owner, David L. Vaughan, River-ton, N. J. Timber, 1 story, 30x45 feet, shingle roof, pine floors, plumbing electric light. Architect taking bids.

Road Work, New Jersey. Owners, State Highway Department, A. Lee Grover, Secty., Broad Street, Bank Building, Trenton, N. J. Monmouth Co., Route 4, Sec. 34, Keyport Cutoff. Reinforced concrete pavement and unclassified excavation. Owners taking bids due October 19th at noon. Deposit of \$10.00 required. Certified check 10%.

Garage, Wenonah, N. J. Owners, Pan-American Prod. Corp., Wenonah, N. J. Brick, concrete, steel. Work contemplated. Too early for details.

Boiler House and Laundry, Trenton, N. J. Architect, William A. Klemann, First National Bank Building, Trenton. Owners, St. Francis' Hospital, Chambers and Hamilton streets, Trenton, N. J. Architect ready for bids.

Convalescent Building, Trenton, N. J. Architects, Department of Institutions and Agencies, Division of Architecture and Construction, Trenton, N. J. Owners, New Jersey State Hospital for Insane, Trenton, N. J. Brick, reinforced concrete, steel, limestone, 3 stories and basement, 111x49 feet 10 inches, slate roof, tile and mastic floors, hollow metal, waterproofing, skylights, sash, tile and marble (heating, plumbing and electric separate). Ready for bids.

Psychopathic Building, Trenton, N. J. Architects, Department of Institutions and Agencies, Trenton, N. J. Owners, New Jersey Hospital for the Insane, Trenton, N. J. Brick, reinforced concrete, steel, limestone, 3 stories and basement, 96x45 feet, slate roof,

tile and mastic floors (heating, plumbing and electric separate), waterproofing, hollow metal doors, skylights, sash, metal lath, tile and marble. Ready for bids.

Nurses' Home, Trenton, N. J. Architects, Department of Institutions and Agencies, Trenton, N. J. Owners, New Jersey State Hospital for Insane, Trenton, N. J. Reinforced concrete, brick, limestone, 2½ stories, 104x34 feet, slate roof, hardwood and tile floors, electric light (plumbing, heating and electric separate), tile and marble work, ornamental iron. Architects ready for bids.

Doctors' Home, Trenton, N. J. Architects, Department of Institutions and Agencies, Trenton, N. J. Owners, New Jersey State Hospital for the Insane, Trenton, N. J. Reinforced concrete, limestone, brick and steel, 2½ stories, 170x29 feet, slate roof, hardwood and tile floors, waterproofing, ornamental iron, metal lath, tile and marble (heating, plumbing and electric separate). Architects ready for bids.

Office Building, Glassboro, N. J. Architect, private plans. Owners, Owens Bottle Co., Glassboro, N. J. Brick, steel, 1 story, 62x34 feet, slag roof, cement and linoleum floors, steam heat, electric light. John N. Gill Const. Co., City Center Building, Phila., taking sub-bids.

Residence, Ventnor, N. J. Architect, V. B. Smith, Guarantee Trust Building, Atlantic City. Owner, H. Williams, Atlantic City, N. J. Cinder block and stucco, 2½ stories, 26x42 feet, tile roof, hardwood floors, hot water heat, electric light, tile work. Architect ready for bids.

Residence, Margate City, N. J. Architect, V. B. Smith, Guarantee Trust Building, Atlantic City. Owner, T. J. Christensen, Guarantee Trust Building, Atlantic City. Cinder block and stucco, 2½ stories, 26x42 feet, tile roof, hardwood floors, hot water heat, electric light, tile work. Architect ready for bids.

Colton Manor Hotel, Pennsylvania avenue, Atlantic City, N. J. Architect, W. Macy Stanton, 1524 Chestnut street, Philadelphia. Owner, care of architect. Brick, stone, steel, concrete, fireproof, 13 stories, 150x150 feet (400-room capacity), steam heat, oil burning equipment, tile and marble work, slag roof, concrete floors, elevators, rolled steel sash, hollow metal doors, iron work. Plans in progress. Contractor is selected. Architect will be ready for bids in two weeks.

Residence and Garage, Haddonfield, N. J. Architects, Trout & Truscott, 222 South Jessup street, Philadelphia. Owner, R. Wayne Kraft, 207 Market street, Camden, N. J. Cinder block, stucco, 2½ stories, 30x80 feet, shingle roof, hardwood floors, hot water heat, electric light, tile work, cement work. Plans in progress. Will be ready for bids in two weeks.

Hospital, Atlantic City, N. J. Architects, H. A. Stout, H. V. Mathis, J. H. Vaughn, Guarantee Trust Building, Atlantic City, N. J. Owners, Atlantic City Hospital, J. Moore, Atlantic City, N. J. Fireproof, 4 stories, 40x165 feet, slag roof, composition and tile floors, hollow tile, elevators, roof ventilators, waterproofing and dampproofing, iron stairs, fire doors, tile and marble, metal lath, steam heat, electric light. Architects taking bids due October 22nd.

Ice Cream Factory and Bakery, 56 Federal street to Taylor, Camden. Architect, H. A. Allen, 526 Stephen street, Camden, N. J. Owner, Bernard C. Foulon, 56 Federal street, Camden, N. J. Present building to be demolished. Brick, limestone, 3 stories (offices), 20x145 feet, 2 stories, (rear) 40x40 feet (heating, plumbing and electric reserved), slag roof, concrete, wood and terrazzo floors, bronze work, marble and terrazzo work. Architect taking bids due October 10th at noon.

Stores (2), Apartments (4), Trenton, N. J. Architect, L. S. Kaplan, First National Bank

Building, Trenton, N. J. Owner, Dr. B. D. Lavine, care of architect. Architect taking bids due as soon as possible.

Residence and Garage, Somerset, Mercer County, N. J. Architect, Walter Hankin, 224 East Hanover street, Trenton, N. J. Owner, George Zimmerman, care of architect. Architect taking bids.

Residences (6), 1141-51 Thurman street, Camden, N. J., \$22,000. Architect, private plans. Owner, Edward Praiss, 1566 Mt. Ephraim avenue, Camden, N. J. Brick, 2 stories, 14x50 feet, slag roof, pine floors, hot water heat, electric light. Permit granted.

Residence, 1300 Dayton street, Camden, N. J., \$4,000. Architect, private plans. Owners, Smith Brothers, 603 Park avenue, Collingswood, N. J. Brick, 2 stories, 14x47 feet, slag roof, pine floors, hot water heat, electric light. Permit granted.

New Jersey Contracts Awarded

Residence and Garage, Ventnor, N. J. Architect, V. B. Smith, Guarantee Trust Building, Atlantic City. Owner, Mrs. L. London, 1329 Atlantic avenue, Atlantic City. Stucco and cinder block, 2½ stories, 27x60 feet, hardwood, pine and cement floors, electric light, tile work. Contract awarded to Philip G. Hannum, Georgia avenue and Thorofare, Atlantic City, N. J.

Garage, Prospect street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owner, Raymond Taylor, Trenton, N. J. Brick, 1 story, 24x44 feet, slag roof, concrete floors, electric work. Contract awarded to Horace Swasey, 541 Perry street, Trenton, N. J.

Hotel Donato (add.), Commerce and Haddon avenues, Atlantic City. Architect, Bertram Ireland, Guarantee Trust Building, Atlantic City. Owner, Frank Fiore, on premises. Contract awarded to W. Beaumont, 1 South Tennessee avenue, Atlantic City.

Residence, 478 Rand street, Camden, N. J., \$5,200. Architect, private plans. Owner, Walter Dietrich, Camden, N. J. Block and stucco, 2 stories, 24x26 feet, rubberoid roof, hardwood and pine floors, hot water heat, electric light. Contract awarded to William R. Hosier & Son, 101 North Twenty-fifth street, Camden, N. J.

Residence, 607 North Thirty-second street, Camden, N. J., \$4,000. Owner, Edwin S. Robbins, 523 South Eighth street, Camden, N. J. Frame, 1½ stories, 25x35 feet, rubberoid shingle roof, hot air heat. Contract awarded to E. Christopherson, 603 North Thirty-second street, Camden.

Hotel (add.), Boardwalk, Atlantic City, N. J. Architects, Carrere & Hastings, 52 Vanderbilt avenue, New York City. Owners, Hotel Chelsea, Atlantic City, N. J. Reinforced concrete, brick, granite, limestone, steel, 9 stories and basement, 240x100 feet (plumbing, heating, electric, elevator reserved), Barrett Specification roof, cement floors, metal lath, tile and marble work, shoring, architectural terra cotta, ornamental iron work, metal stone fronts, mail chutes. Contract awarded F. V. Warren Co., 1913 Arch street, Philadelphia.

Storage Building, 262 Division street, Camden, N. J., \$3,000. Architect, private plans. Owners, Bantivoglio Estate, Camden, N. J. Brick, 1 story, 30x100 feet, slag roof, electric light. Contract awarded to Frank Valeriani, 259 Spruce street, Camden.

Residence, 3266 Pleasant street, Camden, N. J., \$4,000. Architect, private plans. Owner, Charles Kohler, care of builder. Brick, 1 story, 24x36 feet, slate surface roof, hot water heat, electric light. Contract awarded to Adam Stephan, 3309 Pelham Place, Germantown.

Miscellaneous Construction News

Church (Educational Institution), Richmond Park, Wilmington, Del. Architect, Bureau of Architects, Methodist Episcopal, 1701 Arch Street, Philadelphia. Owner, Richardson M. E. Church, Richmond Park, Wilmington, Del. Stone, 1 story. Architect taking bids due Oct. 13th.

Proposal

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the erection and completion of a Senior High School Building to be erected on the plot of ground lying at the northwest corner of West College Avenue and South Beaver Street, York, Pa. The proposals must be submitted separately for the—General construction of the building, Plumbing and Drainage, Electrical Work, and Heating and Ventilating—all in accordance with plans, drawings and specifications prepared by John B. Hamme, Registered Architect, York, Pa. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders.

Plans and specifications may be secured from David N. Crider, Secretary of the Board of Directors, in the Central School Building, corner of West King Street and Cherry alley, York, Pa., upon application accompanied by a deposit of cash or certified check of \$100 for each set of the General plans and specifications, \$85 of which will be returned for each set when plans and specifications are returned to said office accompanied with bid. A deposit or certified check for \$50 must accompany applications for each set of the Plumbing and Drainage, Electrical Work, or Heating and Ventilating plans and specifications, \$35 of which will be returned for each set when plans and specifications are returned accompanied with a bid.

In case no bid is received the entire amount of the deposit or check will be forfeited.

On or about September 21, 1925, plans and specifications will be delivered to persons making application in accordance with the above requirements. Plans and specifications will be on view in the office of John B. Hamme, Registered Architect, Citizens' Savings and Trust Building, in the office of M. O. Lewis, Superintendent of Buildings and Grounds, in the Central School Building, York, Pa., and at the Builders' Exchanges in Philadelphia, Pa., and Baltimore, Md.

All bids must be signed, sealed, properly marked with name of contract bid upon and delivered to David N. Crider, Secretary, Central School Building, York, Pa., not later than one o'clock P. M. of Thursday, October 15, 1925.

The right is reserved to reject any and all bids.

EDWARD W. NEUMANN,

Chairman of the Committee on Buildings, Grounds and Fuel, of the Board of School Directors of the School District of the City of York, Pa.

CONFIDENCE IN RAIL STEEL REINFORCING BARS FULLY MERITED

BY H. J. STAMBAUGH, JR.

Evidence of engineering confidence in rail steel reinforcing bars is strikingly illustrated by the steadily growing number of specifications which designate them.

This confidence is based on solid ground. The test of time and the results of laboratory research have combined to prove the worth of products rolled from steel rails. Buildings in which rail steel reinforcing was used, erected a quarter of a century ago, stand today like granite rocks. No structure ever has failed because of this steel.

Backed by the general conviction of their thorough reliability, these bars have found a wider and wider range of use. From the very narrow field they occupied at the beginning, they now are employed in every kind of work where reinforced concrete is specified.

Rail steel bars meet all requirements to which they have ever been honestly subjected. It is needless for critics to point out that in some isolated laboratory tests they have not held up.

Mere criticism of a material gets nowhere. It must be backed by a substantial array of facts. Specific instances of failure in its varied uses must be pointed out and these instances must be attested by competent witnesses. No such evidence exists as to rail reinforcing bars despite attempts in a few quarters to mold engineering opinion to that end.

On the contrary there are everywhere enduring monuments which demonstrate the complete reliability of the material. These monuments stand forth as the best possible answer to detractors.

Among architects and engineers preferences always will exist. Where one leans strongly to a certain kind or type of material, another chooses to work with a different medium, but if they are sincere neither will condemn the other's choice as undependable or unsafe.

Each year sees more and more barriers of prejudice being broken down in the construction field. This is true of rail steel as of other materials. In a few cities building codes express the biases or the lack of information of the men who drew them and in some cases they were drawn years ago. Pertinent to this is a recent editorial in a technical publication. It reads in part:

"Building codes were probably first adopted by cities for the purpose of protecting life and limb. The occasional failure of a poorly designed or poorly constructed building doubtless furnished the main argument in favor of a building code. But a device for the protection of

life has degenerated in many cities into a device for creating monopolies.* * * *

It is an open question whether building codes should ever go farther in their restrictive rules than to draw a few broad specifications aimed solely to prevent buildings from falling down. But city building department heads have gradually increased the detail of their code specifications until they bid fair ultimately to usurp the function of the designing engineer or architect.

Along with this evolution has come the paternalism of the politician, with his prohibitions 'for the good of the public.' * * *

But building codes which ignore rail steel bars now are so rare as to be listed as curiosities. It seems probable that it

will not be long until there will be no city or town where the ordinances do not regard rail steel as the standard material that it is.

It is natural that increased use of these bars should be noted in connection with the unprecedented building activity of 1925. In every part of the country new marks have been set almost monthly since the first of the year and even in event of a considerable let down during late months of the year, which seems improbable, it is likely that for the twelve months a record of more than \$6,000,000,000 in construction will be shown.

In this work has gone hundreds of thousands of tons of rail steel reinforcing. Some of the most notable commercial and municipal projects have been built under specifications which included this product. One notable example is in Washington, D. C., where United States Army engineers designated rail steel for the filtration plant of the new water works system. This material also is being used in the new water works systems for the cities of St. Louis and Cincinnati.

These are only isolated cases, yet they tend to prove that rail steel bars receive the endorsement of the highest engineering skill in the country. Certainly if the material were questionable, if it had not demonstrated its worth in thousands of instances, it would not even be considered by the foremost authorities on construction.

Refinements in the process of making rail steel bars are constantly going on. Mills which produce the material employ metallurgical experts of high standing who watch the various phases of manufacture and who study ways to turn out a perfect product.

An example of this may be found in the improvements that have been made in the last few years in maintaining even temperatures in the steel as it passes from the furnace to the rolls and then to the hot beds. Changes in furnace design and in the fuel employed also have tended to bring about a high degree of excellence in the material.

Rail steel reinforcing bars have thoroughly established themselves in the list of sturdy building materials by a continuous record of dependability. It is evident that they will maintain their place.

INTERIOR WALL TREATMENTS

Rough textured interior walls soften noises by scattering instead of echoing sound waves. They break up light waves, too, instead of reflecting them in a glare. So the light in a room with textured walls is more subdued than where the surface is hard and flat. Artistically,

textured walls are more interesting than smooth ones, because the texture gives a pleasant variation of light and shadow to the surface.

Walls were treated this way in the chief periods of architecture which influence the design of American homes. Rough plaster effects are found in Spanish, Italian, early English, Gothic, American, Colonial and other dwellings.

But in each period the texture and tone combinations were different. Typical Spanish plaster work is roughly hand finished and its colors are neutral. The early Italian is another "palm finish" but more refined, and there is more variety of color in the Italian interior. It ranges from soft greys and reds to turquoise blue.

Before French and Italian artisans brought in a vogue for ornate caste work, the rooms of English small homes were plastered with a semi-smooth trowel texture and the usual colors were buffs and greys which harmonized with the dark wooden wainscoting and beamed ceilings. In the homes built during the Gothic period in northern Europe the walls were grained by the coarse materials used and marked irregularly by brush and trowel. Greys, tans and buff tones prevailed.

Wallpapers did not come into general use in the American Colonies until shortly before the Revolution. Previous to that white or greyish plaster was used, with or without wood paneling, in textures ranging from a smooth sand float finish to a coarser stipple.

There are other wall treatments typical of other period styles. If your home is designed in one of these styles and if you wish its interior to reflect the general feeling of the design, the walls should be treated as described.

To most folks "period interior" means brocade or velvet hangings, hand-wrought metal, antique furniture and sculpture. Such things give the spirit of palaces. But what most of us want is not the splendor of the palace but the quaintness, picturesqueness or charm of the cottage of one of the great periods of home building.

This can be attained without great cost. These simple textured wall treatments not only harmonize with the general architecture of the room, but they provide proper backgrounds for the furniture, draperies and rugs which we can afford and which carry out the spirit of the room.

It is inexpensive and simple to get these effects with the plastic paints now on the market which give both texture and tone in one coat. It is best to size the wall first, and another coat of size over the outer surface makes it washable.

These paints come as white powders to be mixed with water to a thick paste. Then dry pigments dissolved in water or oil colors thinned in turpentine are stirred in and the material is brushed on. When it begins to stiffen it should be gone over with a wall brush, stippling brush, palm of the hand, finger tips or wad of crumpled cloth or paper to produce the texture desired.—*The Small Home*.

UNDERWRITERS REDUCE INSURANCE RATES ON ELEVATORS EQUIPED WITH INTERLOCKS APPROVED BY BUREAU OF STANDARDS

The importance of the work which the Bureau of Standards, Department of Commerce, is conducting on elevator interlocks is forcibly illustrated by the fact that the National Bureau of Casualty and Surety Underwriters, one of the largest groups of this kind in the United States, has recently granted a reduction in insurance rates on elevators equipped with interlocks which have passed the Bureau of Standards' tests.

A substantial saving in insurance rates has thus been made possible, but far more important than this and of course the reason underlying the above action, is the greater assurance of safety in elevators equipped with devices which have successfully passed these tests. The best statistical information available indicates that effective hoistway door elevator interlocks would have prevented three-fourths of the fatal elevator accidents which have occurred in the past.

This work was originally undertaken for the City of Baltimore, but has been extended to include tests for the Office of the Supervising Architect and for the District of Columbia. The tests will probably also be utilized in the near future by a number of State safety commissions.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America
write practically every form of insurance except life

"ANTI-HYDRO" Keeps a Canal Out of this Building

The concrete basement wall is also the canal wall. Water flows continually against the outside, but the inside of the wall is dry as a bone.

This concrete wall was waterproofed with "ANTI-HYDRO" twelve years ago. Not a drop of moisture has ever penetrated through it during all these years.

"ANTI-HYDRO" waterproofs concrete *permanently* against any head of water. It also increases both the tensile and compressive strength of concrete and makes it extremely hard, all in *one operation*.

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. It mixes readily with the gauging water without the aid of skilled labor. For 21 years "ANTI-HYDRO" has been the accepted standard. Be sure to use it on your next job.

REDUCE COAL BILLS REDUCE RADIATION

Six Reasons why you should
insulate your home with
ARMSTRONG'S (Nonpareil) CORKBOARD

1. An excellent non-conductor of heat.
2. Non-absorbent and sanitary.
3. Structurally strong and easy to install.
4. An excellent base for plaster.
5. Slow burning and fire retardant.
6. Reasonable in cost.

Buildings, Somerville, Mass. Architect, Albert Kahn, Marquette Building, Detroit, Mich. Owners, Ford Motor Co., Detroit, Mich. Brick, concrete, cut stone, limestone, 300x1200 feet, 1 story, cement, tile, built-up roof, asbes-

tos roof, cement, wood block floors, painting, waterproofing and dampproofing, ornamental iron work, iron stairs, bond, steel and kalamein doors, rolled steel skylights, tile and marble work, terrazzo work, metal lath, caisson, piles, pile driving, metal toilet partitions (plumbing, electric, sprinkler system, steel sash, steel sash operators separate bids) (structural steel work reserved). Contract awarded Blair Const. Co., Memphis, Tennessee.

Dormitory, Newark, Del. Architects, Day & Klauder, Franklin Bank Building, Philadelphia. Owners, Delaware University, on premises. Low bidder, James H. Hutchinson, Newark, Del., \$134,900.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Low bidders on work received October 7th:

Contract CN19B, Lum's Pone, .25 mile. F. W. Lovett, Newark, Del., \$10,870.40.

Contract C.19C, grading Summit Bridge Approach, .41 mile. William T. Staats, York, Pa., \$5,202.

Contract CS38, Vines Creek-St. George's Church, 3.05 miles. George & Lynch, Dover, Del., stone \$80,647.50, slag \$78,667.50.

Contract CS46, Cannon-Atlanta, 2.12 miles. George & Lynch, Dover, Del., stone concrete pavement, metal joint \$60,906, non-metal joint \$60,234; slag concrete pavement, metal joint \$59,751, non-metal joint \$59,079.

Delaware Contracts Awarded

Boiler House and Laundry, Wilmington, Del. Architect, R. P. Schoenijahn, Industrial Trust Building, Wilmington. Owners, Homeopathic Hospital, 1501 Van Buren street, Wilmington. Brick, 1 story, 31x62 feet, slate roof, concrete and composition floors, roof ventilators, plate glass, sheet metal work, steel work, electric light, rolled steel sash. Contract awarded to W. D. Haddock & Co., 804 Orange street, Wilmington.

tos roof, cement, wood block floors, painting, waterproofing and dampproofing, ornamental iron work, iron stairs, bond, steel and kalamein doors, rolled steel skylights, tile and marble work, terrazzo work, metal lath, caisson, piles, pile driving, metal toilet partitions (plumbing, electric, sprinkler system, steel sash, steel sash operators separate bids) (structural steel work reserved). Contract awarded Blair Const. Co., Memphis, Tennessee.

Residence, Garage and Gardeners' Cottage, Winston-Salem, N. C. Architects, Charles Barton Keen & Wallace, 338 South Smedley street, Philadelphia. Owner, Robert E. Follin, care of architects. Brick, cut stone, concrete, 2½ stories and basement, 1 story, 60x31 feet, wing 31x17 feet, tea house 18x8 feet, servants' house 16x18 feet, garage 26x16 feet, tile, Barrett Specification roof, tin roof, oak, pine and cement floors, waterproofing, ornamental iron work, bond, trusecon or Medusa waterproofing, hardware, incinerator, soundproofing, hardware, stair work, metal lath, painting, glazing (plumbing, heating, electric, tile, linoleum floors, range work, insect screens, weather stripping, finished hardware, hardwood floors reserved). Contract awarded Fogle Brothers, Winston-Salem, N. C.

Court House (alts. and add.), Rappahannock, Virginia. Architect, E. C. May, Dupont Building, Wilmington, Del. Owners, Borough of Rappahannock, care of architect. Brick, stone, 2 stories, 50x150 feet, slate roof, tile floors, steam heat, electric light, tile and marble, general alterations to old building. Contract awarded to L. T. Collins, Richmond, Va.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

THERE IS STILL A BUILDING SHORTAGE

Here Are the Results of a Country Wide Survey Made by Building Age and National Builder

SEVERAL items have recently appeared in our newspapers and general magazines stating that: owing to the large volume of construction already accomplished, the building shortage was overcome, and that, after 1925, building activity would be limited only to our normal building needs.

Is there any foundation for these rumors?

The great question is:

What is the building situation today?

Has the phenomenal amount of building activity in the last few years overcome the great shortage resulting from the cessation of practically all building construction during the world war period?

The answer to this question is presented herewith—the result of a survey made by *Building Age* and *National Builder* through the various Chambers of Commerce in the United States.

Four years ago, and again two years ago, we made a similar survey which proved helpful to the building industry in particular, and to the nation generally. The record-breaking amount of building construction during last year and this year has been credited as the greatest factor in the prosperity of the United States. The present survey, it is hoped, will be found as valuable as our previous surveys, covering similar building needs.

The figures here presented are based on facts. In the present instance, a questionnaire was addressed to the Chambers of Commerce, Boards of Trade, or other commercial organizations in various cities and towns throughout the United States. We received reports from over 700 cities and towns and, of these, 590 gave complete detailed reports on which we could base our figures.

These reports are not confined to any one state or section but come from every

state in the Union so that the figures given can fairly be relied upon, according to the general law of averages, as representing the building needs of the United States at the present time.

One of the most interesting facts revealed by our investigation is that, despite the large amount of buildings constructed in our cities, there is still today a very considerable shortage of homes and other buildings in our cities of over 25,000 population.

The biggest needs for such buildings seem to be in cities of between 25,000 and 75,000 population, which indicates that small cities are growing rapidly in population. This is borne out by reports from different government departments, financial institutions, and real estate associations.

There has been a decided movement of our population to the suburbs from the larger cities, but the larger cities

Total	34,817	\$324,572,250	49,361	\$381,453,580

themselves still continue to increase. The reports of real estate transactions show remarkable activity in the sale of lots for homes, etc., in our smaller cities that are suburbs of our larger cities.

Our figures disclose that, though apartment houses still find favor in our smaller cities, the demand for them in the smaller cities is not so very heavy, and that the greatest apartment house demand is still in the large cities.

There is very great demand throughout the United States for small one family houses, especially those costing less than \$5,000. This demand has not been met to any great extent despite the past three years of abnormal building.

Our report shows that nearly 220,000 of such buildings are still needed today in the United States to bring the demand back to a normal basis.

Our report further discloses that over 100,000 single family houses costing from \$5,000 to \$10,000 are needed.

The greatest single need then, that the building industry must do its best to fill if we are to overcome the housing shortage, is for moderate cost single family dwellings.

We have been spending money for

higher grade buildings but have been ignoring the small home structure.

There has been a decided tendency in the last few years for people to own a home of their own rather than to rent either a house or an apartment.

What Our Figures Do Not Show

Our figures do not include farm buildings other than dwellings. The present number of farms in the United States, making allowance for a reasonable increase since 1920 when the number of farms reported was 6,448,000, must at present be fully 6,500,000. The total number of buildings on these farms, other than dwellings, is, according to the best available information, about 42,250,000. These, estimated at a conservative figure, have an average money value of \$300 each.

There is an average of seven and one-half buildings for each farm, divided as follows for each 100 farms; houses, 100; graineries, 67.4; hog houses, 67.7; chicken houses, 90; cattle sheds, 45; corn cribs, 66.8; silos, 23.3; barns, 134; woodsheds, 54.7; garages, 48.7.

It is very conservative to consider 50 years to be the average life of the average farm building. This would mean,

then, a replacement of practically 907,500 farm structures each year.

It is only within the past year that the farmer has been in a position to do much new building. It is reasonable to assume that it will take two years to catch up with normal requirements, both for new buildings and for the replacement of old ones. There is then a shortage of approximately 1,819,800 structures. At an average value of \$300 each, these amount to a total of \$545,940,000.

Lest these figures seem high, consider that there are not less than 6,500,000 farms in the United States. This means that this new construction needed would amount only to \$84 for each farm—a very moderate estimate indeed.

Another class of structures must be considered in connection with a survey of farming community needs. The farmer is now equalizing prices of his products by building storage houses so that he is no longer under the necessity of selling immediately following harvests.

It is also not unreasonable to assume that, in addition to the public warehouses, small subsidiary warehouses will be built by the farmers themselves and the value of these is estimated to be \$1.250,000. These items, added to that for other new

buildings, make a grand total of \$549,690,000 for rural needs, exclusive of the \$558,232,000 needed for residences and other structures as given in our first table. These total to \$1,107,922,000.

The money value of the present building shortage therefore totals as follows:

Total Building Shortage	
Cities of over 25,000 population	\$2,407,656,000
Cities and Towns of 2,500 to 25,000	1,326,243,985
Rural	1,107,922,000
Military and Naval Building	2,000,000
Public Works	400,000,000
	\$5,243,821,985

In making estimates of the cost of the various buildings given in this survey, the price is based on averages from all reporting. These are given in the following table:

Average Costs of Buildings

Based on Reports from 590 Cities and Towns

Type of Building	Average Costs			Estimated Costs Building Dept. *Figures
	Cities Over, 25,000	Towns and Cities 2,500-25,000	Rural Under 2,500

*From Building Department Reports for 277 Cities.

This table presents:

First, the average price of the different structures in large cities.

Second, the average price of the same structures in towns and small cities.

Third, the average prices in the rural districts (comprising towns under 2,500 population and farming communities.)

By way of comparison, we give similar estimates for the same type of structure found in reports of estimated costs taken from the building permits of 277 cities having building departments.

In the majority of these cases it will be noted that the estimate of the costs in the building permits are under our figures but we must remember that the actual cost in most cases will be found to average more than the first estimate given in the building department application. We consider, therefore that our figures are more reliable as showing actual average costs at the present time.

Well worth noting is the average cost computed for private garages in towns of over 25,000 population and in towns of 2,500 to 25,000. In the first case unit cost is given at \$389, while the small town reports an average cost of \$477. Interpreting this difference in unit value, it is inferred that while the construction of the small city private garage is less expensive, provisions are made in many cases for two or more cars, while in larger cities this type of structure is not so common.

Again, the average costs of schools in both rural districts and in towns below 25,000 is given to be higher than that computed a few years ago. This increase is due to the present educational policy of erecting better school buildings, each one to serve a larger territory than formerly. In short, the little school-house, so much in vogue a decade ago,

be made up before normal conditions again prevail. Each year, of course, brings its own amount of normal building which increases year by year as population increases.

Figures in another part of this article disclose the amount of homes that are needed every year to meet the annual increase in population, but besides homes we have to erect various other structures to accommodate this annual increase of population. They need places to work in, places in which to buy things, places in which to worship, amusement places, hospitals, educational buildings, etc.

We can better visualize the annual building needs of the United States when we state that it is necessary each year to build in the aggregate a city the size of Philadelphia with all its various kinds of buildings and industries! And this is the third largest city in the United States with a population of 1,873,070 (1920 census figure).

Statement of the Ownership, Management, Circulation, etc.

(My commission expires March 2, 1929.)

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

Men are walking by and around people that want to buy from them, and do not know it.

The DAILY BUILDING NEWS will tell you who wants to buy your products.

BUILDING NEWS PUBLISHING CO.
1530 Chestnut St. Philadelphia.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

is rapidly giving way to more elaborate buildings similar to those found in densely settled communities.

Homes Needed Annually Due to Increasing Population

That some idea may be given of the normal requirements for housing, we must consider that the increase in population, 1,873,076 annually, amounts to 5,132 persons per day. The average number of persons in a family is five, so it is absolutely necessary for the United States to provide 1,026 new homes every day in the year! As there are 365 days in a year, this means that annually there are 374,615 homes needed in this country. To this, should be added replacements of existing structures made necessary by decay, fire loss, etc.

Our figures disclose that as we enter 1926 the actual building situation is still over a year behind, and this shortage, plus normal annual requirements, has to

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

“There’s not a drop of Hot Water, Dad-- Won’t you Please get us a Tank Heater?”

This young lady has a right to complain. Hot water is so easy to supply these days in BIG QUANTITIES with a Novelty Tank Heater, that there is little excuse for running short. The families that have put in these famous little heaters have rid themselves of hot water worries forever—and houses equipped with them are more acceptable to tenants.

Nothing could be simpler to operate than the

A shovelful of pea coal or buckwheat coal morning and night keeps a FORTY GALLON tank constantly full of steaming hot water. Moreover, it does this at but 5 cents a day—one-quarter the cost of gas. (This is unprejudiced, for we make both kinds.)

We were the originators of this type of coal tank heater, and there are now imitations. Install the NOVELTY with its brick-lined fire-pot, baffled water-way, two-bar rocking grate, and reinforcement rods at the sides. Look for the name Novelty on the door.

PLENTY of hot water for bathing, for laundry work and for the kitchen is needed in the average household—a 40-gallon tankful all the time—and the Novelty is designed to supply it.

Get all the facts—now! Write or phone today for complete information. Address Dept. BG-10.

ABRAM COX STOVE COMPANY

Factory and Show Room, American & Dauphin Sts., Phila. Established 1847

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., Oct. 15, 1925.—SEALED PROPOSALS will be opened in this office at 3 P. M., Nov. 12, 1925, for remodeling and enlarging the U. S. Post Office at Fulton, N. Y. Drawings and specifications may be obtained from the Custodian at Fulton, N. Y., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

GREATEST NATIONAL CONFERENCE IN THE HISTORY OF THE CONSTRUCTION INDUSTRY

As part of its Annual Meeting this year, which will take place in Chicago on November 18th to 21st, the American Construction Council will hold a series of conferences of the greatest importance to the construction industry and American business in general.

One of the principal features of the meeting will be a national conference on Better Building. This will be a two days' session and will be attended from all parts of the country and Canada by representatives of the various branches of the industry, including building investment, design, insurance, manufacturing, builders, labor and public officials and all others interested.

This conference is designed to bring out the particular place that each branch of the industry holds in the entire problem of Better Building and its relation to the public. The place of craftsmanship and apprentice training in Better Building will also receive consideration.

The American Construction Council has been the leader nationally in a num-

ber of movements on fundamental questions confronting the construction industry and its relation to the public. It has been particularly vigorous on the problem of Better Building, having inaugurated several years ago a nationwide campaign to promote better quality of construction and sounder financing in building, especially housing. The newspapers of the country have given enthusiastic support to the movement and the active co-operation of many elements of the industry, including loaning institutions, has already been pledged to assist in putting the desired remedies into practice. The Council's General Committee on Better Building, under the Chairmanship of Mr. Rudolph P. Miller, of New York, has been preparing literature on this subject for national distribution to prospective home owners as well as co-operating with loaning institutions and others in getting proper standards set up.

In this connection attention is called to the fact that Regional Committees of the Council are being inaugurated in leading construction areas of the country so as to bring together the various branches of the industry in their respective districts to handle questions of common concern. These committees, for example, will help develop measures for better planned, better financed, and better constructed homes in these communities.

The third day of the Council's meeting will begin with a general session on the reduction of construction peaks and depressions. Aside from general discussion there will be a report of the joint committee of the Council and the American Railway Association on the co-ordination of publicity for a country-wide campaign on greater stabilization of construction.

There will also be a session on local building congresses. Another session will be devoted to the place of commercial arbitration in the construction industry with special reference to its national aspects.

On Saturday, November 21st, there will be a national conference on highway construction, particularly as it relates to better building of highways.

Group meetings of the constituent elements of the Council for discussion of special problems and the election of representatives to the Council's Board of Governors will be held. A meeting of the Board of Governors and the Executive Committee will precede the opening of the general sessions of the Council on the 18th.

In addition to persons within the industry who will discuss the particular topics, speakers of national prominence will address the general sessions of the Council's meeting.

The concrete benefits of the Council's efforts are becoming so well recognized

by the public and the industry itself that these conferences are expected to attract a wide attendance and give further incentive to individuals and organizations toward the further support of its work.

REVIEW OF OPINION ON WINTER CONSTRUCTION

IS IT REALLY EVER TOO COLD TO BUILD?

A digest of opinion taken from government reports, engineers, architects, contractors, and leading building journals shows that the building industry as well as the public no longer believes that it is necessary to suspend construction work during winter weather. Government records show that there are but few days in the average winter when temperatures are near zero during working hours even in cities as far north as Chicago, New York or Boston.

"Custom, not climate, is mainly responsible for seasonal idleness in the construction industries" reports the committee which Secretary Hoover appointed to investigate the situation.

Quoting from the report we read that:

"The burden of idleness falls most heavily not on the producers and distributors but on the employes and the public. Construction costs are high in part because of the seasonal hazard which affects each step of the construction process from felling timber, quarrying rock, manufacturing brick, cement, tile, plaster, and a hundred and one other commodities, transporting these materials by railway, waterway, and highway, distributing them through retail supply dealers, clearing of site and excavating, to the completion and furnishing of the finished building. Idle time represents waste and direct losses to the construction industries, the workers, and the public."

Turning to another cabinet official for information, James J. Davis, Secretary of Labor, says that "more than 11,000,000 of our people are dependent for their living on the construction industry." And from a survey of normal conditions in Boston by a *Building Congress* we learn—

"That the workmen in the industry are, on an average, occupied for about 75 per cent. of the time, or nine months a year. During the time when they are employed they must be paid enough to support them and their families in the idle period, the equivalent of an enforced three months' vacation with pay. The Congress estimates that this costs the owners of property and renters in Boston \$10,800,000 annually."

From these figures the loss to the people in Boston caused by seasonal idleness in the construction industry is found to be \$14.80 per capita per year and if the

average loss per capita in Boston resulting from seasonal idleness is applicable to the nation as a whole, the people of the United States pay out \$1,564,360,000 annually to support those engaged in the construction industries and their families during such periods of unnecessary idleness. This would build 52,000 miles of permanent highway pavement each year or erect 31,000 schools at \$50,000 each.

As the *Constructor* sees it, "The construction industry has a remarkable opportunity to engage in valuable foresight in connection with the winter building campaign at this particular time. Every word now spoken and every action now taken to aid the effort to eliminate seasonal depression will show its effect in months to come."

D. Knickerbacker Boyd, President of the Philadelphia Building Congress discusses in *Engineering News-Record* the causes of inactivity in construction in the winter months, saying that:

"More possible working days are lost by workers in the building 'trades' than by those in almost any other industry."

"The year's work is literally 'shot to pieces' by intermittency, due to unemployment, not only from seasonal causes, which for the most part could be overcome, but from other causes many of which are related. Among them is (1) indoor work so often unnecessarily required to be done in warm weather and in a crowded construction period when it could be deferred till colder weather and a lowered employment period, (2) demolition not being started until the time of the year that the new construction which replaces the old should itself be under way, (3) lack of foresight in ordering or assembling materials or fabricated products in advance of construction needs, (4) delays in closing contracts with subcontractors sometimes unfortunately due to the other unfair practice of 'shopping' for lower estimates."

The Hoover Committee finds that the situation is bad from the employer's standpoint, since available statistics from all elements of the building industry show that the average workman is forced to idleness during anywhere from 25 to 35 per cent. of the year. This means that good mechanics are out of work and looking for work during three or four months of the year, using up the savings they have laid aside during the busy season.

The slackening of construction affects not only labor but material dealers and contractors as well. The Report goes on to say:

"That there are months when sales of most building materials drop off sharply is indicated by replies from dealers all over the country. Four hundred questionnaires were sent out, asking for 1922 sales of various materials month by

month. The general high level of sales for practically all materials, as shown by the replies received, comes in the five months from June to October. From the latter month there is a rapid decline which reaches a low point in January or February. The volume of sales then starts to pick up and increases steadily until the peak is again reached."

How winter idleness is being fought with unusual success in Rochester, New York, is told in a recent editorial in *Engineering News-Record*. The campaign has been carried on primarily by the Community Conference Board sponsored by the Chamber of Commerce.

"This board is made up of men representative of various interests in the construction industry and began work in the fall of 1921. Its effectiveness was shown almost immediately. During the first winter of 1921-22, as a result of publicity, urging winter remodeling and redecorative work, over 17,000 days of work were provided. An increasing amount of this work has been done every succeeding winter. In 1921 the December-March permits for building were 20 per cent. of the year's total. In 1924 they were 27 per cent. of this total."

WINTER CONSTRUCTION ON THE INCREASE

The building season is gradually being lengthened as the result of a drive undertaken by the Construction Industries in co-operation with the Department of Commerce. This fact has been established through a survey made by the Division of Building and Housing of the Department at the direction of Secretary Hoover to determine what results were being obtained. Reports from contractors in sixteen large cities show that payrolls and material purchases were relatively larger in the winter months of 1924 than in those of 1923. The 1923 figures in turn showed an increase over 1922. Payrolls and material bills are measures of building activity which follow actual work very closely.

The large number of contractors who answered the Department's inquiry gave figures showing for each month the percentage of the year's total. Practically all replies had the same trend, making an average a fair statement of conditions as given. Changes in general business conditions and a difference in the weather undoubtedly had some share in the result. But making allowance for such factors, a distinct improvement in the relative amount of winter building is apparent.

There are already favorable indications for the coming winter. The August figures for contracts awarded for all classes of construction have proved to be the highest ever known. Many of the opera-

tions represented by these contracts will undoubtedly be carried over into the cold weather.

All groups in the building industry are trying earnestly to bring about a more equal distribution of work throughout the year. Their efforts are bringing results. More and more people are becoming convinced that winter construction is both practical and economical. The growth of this belief is certain to result in steadier employment and more efficient construction service.

WINTER-TIME BARGAINS FOR BUILDERS AND OWNERS

In an address before the New York Building Congress, John W. Lowry told how "an expenditure of \$3,863 for protection of workers and materials saved \$87,710 on a job costing \$750,000." He explained how the efficiency of bricklayers increased 18½ per cent over the summer before, which accounted for a \$5,360 saving, bricklayers bonuses to the amount of \$11,260 were eliminated, savings on labor and subcontractors over the previous summer prices amounted to \$16,030 additional, and so on through the entire list of savings.

W. J. Barney, president of a large contracting firm in New York City says:

"From our files, I have taken three typical contracts, and the amounts given under the total contract column are practically for the reinforced-concrete structure, the enclosing walls, sash and roof, in other words, for that part of the building which requires protection from winter winds, freezing and cold in the course of construction. Once the building is enclosed, the matter of heating for the finishing trades is comparatively simple, especially if the permanent heating plant has promptly followed up the structural work. In a general way, about 5 per cent. of the contract represents the cost of winter protection.

"Total contract, \$263,000; time of protection, December-January; cost of protection, \$13,000; percentage costs, 5.

"Total contract, \$180,000; time of protection, December-January; cost of protection, \$8,800; percentage costs, 4½.

"Total contract, \$95,000; time of protection, January-February; cost of protection, \$6,300; percentage costs, 6½.

"This, however, does not represent the true cost of winter construction. As the cost of this winter protection, especially under present conditions of the labor and material markets, is more than offset by the lower cost of materials during the winter, the absence of bonuses paid to mechanics, and a greater efficiency of mechanics under conditions when work is not so plentiful."

Mr. Barney further found economies, in that lumber purchased in June cost

approximately 10 per cent. more than if purchased in November, and particularly ¾ inch boards which are largely used for form construction cost \$1 per thousand less in November than in August. He also found important savings in common brick for curtain walls, reinforcing steel, and received the benefit of a seasonal drop in cement. His idea of the efficiency of labor working on winter jobs is given in the following paragraph:

"We know that it is now possible to obtain practically all laborers and skilled mechanics, especially in reinforced-concrete construction, at the established union rates, and that, moreover, the men are anxious and willing to work efficiently and skillfully and have interest in holding their positions."

During the past five years, the Dwight P. Robinson Construction Co. has been on at least 20 jobs where excavation, concrete and masonry work was done in winter months, but as D. D. Dick, Assistant Construction Manager for the company tells *American Contractor* "in no case did the cost of protection amount to as much as closing down the job nor equal the carrying charges on the investment during the delay in the completion of the work," while Alfred S. Alschuler, a prominent Chicago architect tells the same magazine that "it is certainly 'conservative' to say that winter construction will cost an owner no more than summer work and in many cases owners will profit by proceeding with their work regardless of weather conditions."

To the contractor who fears that his labor will be slowed down by cold weather, A. P. Greensfelder, Vice-President of the Associated General Contractors says:

"Have you ever stopped to realize how summer heat affects your labor and slows up their production?"

"One quarryman has declared that he would rather shut down his quarry when it is 100 degrees in the shade and operate it a month longer in the winter time when it is only 20 degrees in the sun."

"I am inclined to agree with him that his efficiency per man-hour would be greater in the cold weather than in the extremely hot months."

On the same subject, Sanford E. Thompson of the Hoover Committee compares labor productivity in summer and winter. The comparison shows an average of approximately 15 per cent. saving in brick masonry labor, about 6 per cent. saving on reinforcement labor, and about 11 per cent. saving on concrete labor while the form labor costs about 8 per cent. more on account of the difficulties encountered by carpenters in handling tools and nails when encumbered with heavy clothing and gloves.

Halbert P. Gillette, Editor of *Engineering and Contracting* writes: "When consideration is given to all the elements of costs, then winter building construction becomes so clearly economic that even the most deep set habit of aversion to it cannot survive."

HOUSING ESSAY PRIZES

*Better Homes for Brain-workers
World-wide Movement*

In an effort to encourage better housing for intellectual workers, the Interna-

tional Federation of Building and Public Works, with headquarters at 17 Avenue Carnot, Paris, France, announces the organization of an international essay competition for which Willard Reed Messenger, of New York, has offered \$1,000 in prizes. The first prize will be \$500; the second prize \$300; the third prize \$200.

Participants should submit their papers typed in French or English not exceeding four to five thousand words which may be accompanied by sketches, not later than January 15th, and prizes will be awarded the following month.

Papers should include the four following divisions, states the official announcement just issued from Paris.

I. Administrative or legislative measures for facilitating the construction of houses intended for the middle classes or intellectual workers.

II. Financial policy,—loans, amortization, etc.

III. New construction methods intended to reduce the cost of building, together with sketches.

IV. Conclusions.

The data submitted and sketches must bear some legend or pseudonym and be sent with an enclosed plain, sealed envelope bearing only the legend on the outside and containing enclosed the name, address and profession of the competitor, which will be opened only after the winners have been selected by the Jury of Judges.

The Jury will include at least two American members, three members will be named by the International Federation and three by the French National Federation, and three members named jointly by these two organizations. The Jury will choose its own President.

The subject of better housing for brain-workers was given primary consideration at the bi-ennial Congress of the International Federation, held in Paris in June, at which forty nations were represented, and to which President Coolidge appointed several American delegates.

STUCCO WALL TREATMENT

When stucco is used it should be applied in different textures to homes of different period-designs. First, because some textures harmonize better than others with certain architectural styles. For instance, a heavy brush finish that would appear well on a Spanish dwelling would be a false note in a Colonial design.

Another reason is that each great period developed its own method of handling stucco. These methods produced distinctive textures. So the old English stucco surface is different from the early Ital-

ian or the California mission surfaces. The texture is, in fact, part of the style.

This doesn't mean there is only one kind of stucco work for each kind of house. The individual has plenty of freedom for the expression of his taste. But there are certain types of finish that should be used on homes of various period-designs.

Spanish builders applied white, yellow or pink stuccos with coarse brushes and then smoothed down the shaggiest spots by hand. This produced a thick rough surface which gave a strong effect of light-and-shade under the intense sunlight. A modern plasterer can get the same result by making broad sweeps over the surface with a wall brush.

The French is another brush texture. But it isn't as heavy or irregular as the Spanish, and it shows parallel up-and-down brush marks. Light greys, creams and white are typical of the French stuccoed cottage. This finish is simple to reproduce with a stiff brush or broom.

Early Italian and English Cottage are the two types of home that rough trowel textures harmonize with. The Italians used white, buffs, pinks and cream. Their textures can be reproduced today by applying the stucco in an uneven surface and then roughening it as it begins to set by dragging the back edge of the trowel in short curved strokes.

On the old half-timbered English cottage, the plasterers strove for a smooth surface but seldom got it. Semi-circular marks of their rude trowels were left visible, giving an effect that is part of the quaint charm of the housing. This effect can be obtained by working the trowel at an angle so that it gouges the surface. The typical English colors are soft buffs, tans and greys.

Rough cast or spatter-dash surfaces in reds, tans, buffs and yellows are typical of the California missions. The textures can be produced by bringing the stucco to an even surface, then spattering it with a thinner creamy mix, using a long fiber brush or whisk broom.

Contrasting with these heavy textures is the American Colonial. Whenever the colonists used stucco, they finished it with a wood float which left an almost smooth texture resembling a fine stipple. This may be done today by any plasterer who knows how to handle a wood float.

These are examples of the ways stucco may be harmonized with period-designs. The desired effects can be had from any Portland cement stucco-finish into which mineral colors are ground at the factory.

Stucco should be reinforced by a self furring welded steel fabric. There should be two base coats totaling seven-eighths inch to an inch thickness, and the finish coat should be an eighth to a quarter inch thick.—*The Small Home*.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

These Preserving People Preserve Their Concrete Floors with "ANTI-HYDRO"

The concrete floor in the basement of this building is constantly subjected to the severe conditions peculiar to this industry. Yet "ANTI-HYDRO" has so thoroughly and permanently hardened the concrete that it is unaffected by acids, oil, water and wear. "ANTI-HYDRO" is extremely easy and economical to use. Being a liquid, it mixes readily with the gauging water and through the concrete, insuring uniform strength and hardness to the concrete. It accelerates the set of cement without weakening it and so enriches it that much of the finishers' time is saved and overtime work is eliminated.

For 21 years "ANTI-HYDRO" has been the accepted standard. Results are always permanent and results are what count. Use it on your next job.

As The Editor Sees It

REVIEW OF OPINION ON WINTER CONSTRUCTION

(Continued from last issue)

CHANGES IN ART OF CONSTRUCTION

The changes in methods and improvement in construction equipment have been scarcely less astounding in the last generation than the discoveries in medicine and chemistry and the inventions of machines and improvements of methods in the fields of industry and transportation.

On this subject J. Reid Kilpatrick, Vice-President of Geo. A. Fuller & Co., of New York City says:

"Excavating is now as simple and as easy in the winter as at any other time of the year. We never see hand excavation any more. It is all done by steam shovels which can work in frozen ground very nearly as easily as they can when the ground is soft. The placing of the concrete is not a serious problem. It is a very simple matter to heat the aggregate. We have poured concrete at 40° below zero in Canada.

"The opinion has existed for some time that steel work in winter is particularly hazardous on account of ice and snow. I have investigated this and find that there is really no difference.

"We can lay brick at 23 to 25° above zero. As our various foremen have told us, they are convinced that we can go considerably lower than that if necessary."

In another article Mr. Kilpatrick states that:

"As regards New York, we have prepared careful statistics extending from 1912 to 1922, a 10-year period, and we have found the average length of time that a winter building program would be rendered impossible due to temperature conditions is 14 days. Winter work is not new, revolutionary or untried. We have been doing it in New York on big jobs for the last 23 years."

C. S. Hill, Associate Editor, *Engineering News-Record*, in a study of the situation writes:

"In no respect, perhaps, has the contractor been so much aided in his ability to work in winter as by wide invention and improvement in construction equipment. Let us look at a single illustration. Without the modern highly improved hoisting machine and the pneumatic hammer, steel framework would have fallen considerably short of its present possibilities of being successfully prosecuted in winter.

"It is practicable to consider only broad phases in equipment development as it has affected winter work. Machines and even types of machines are too numerous to be considered individually. The phases are: (1) size and power, (2) mobility, (3) mechanical perfection and, (4) special-purpose machine invention.

"Increase in size and power aids the winter builder in a number of ways:

"1. Larger shop-fabricated units can be

handled, as in steel erection and form construction, thus reducing manual operations in the field.

"2. In concrete work larger containers, buckets and cars conserve the temperature of heated concrete.

"3. In excavation the heavier shovels readily dig frozen ground and with motor trucks, larger cars and more powerful derricks the frozen earth and rock can be loaded and hauled in larger pieces and so reduce secondary reduction in pit and quarry.

"Summed up in a sentence, the present high development in variety, power, mobility and mechanical perfection of construction equipment reduces the necessary human elements in winter construction."

The fiftieth Anniversary Number of *Engineering News-Record* which appeared April 17, 1924, traces the development not only of machines in the preceding half century but the improvements in methods as well. These stories of advances in equipment and methods are as captivating as any popular fiction.

The first percussion rock drill was introduced in 1849. It was operated by steam at first but compressed air was substituted a year or two later. For the first years, improvements were slow but these original drills, crude though they were, were the forerunners of our present day drilling tools of near mechanical perfection and compactness.

The first patent for a power shovel was

granted by the U. S. Government in 1839 to Wm. Smith Otis. It was operated by steam, whereas modern excavating machinery is operated by electricity, gasoline engines, compressed air, or heavy oil engines of the Diesel type, as well as steam.

In reviewing the development of construction equipment, the Anniversary Number of *Engineering News-Record* states:

"Material costs and labor rates have steadily gone up but the unit of production has as steadily increased, so that, as William Mulholland points out on another page of this issue, 'the cost of completed work remains about the same, mainly due to a great improvement in mechanical means of doing work.'

"This is the great contribution of the machinery builder to the progress of the past half century. For the American contractor of today, the equipment manufacturer has provided an efficient machine at a reasonable price for almost every one of the scores of operations formerly done by hand. In no other country in the world is the range of selection so wide and the design and materials so perfected."

It is sometimes said that materials of construction have changed but little since ancient times. It is true that materials used by the ancients are still in use but many new materials have been introduced in the last few decades. The first portland cement made in this country was produced in 1872. The production of rolled steel shapes in large quantities did not begin until 1890. The influence of reinforced concrete became important only about 1910—and since then a number of buildings 20 stories or more in

height have been constructed entirely of reinforced concrete. On this subject the Hoover Committee says:

"Steel construction could hardly have attained its present independence of the weather but for the hoisting engine and the use of air-driven tools. The former was adapted for building purposes about 1895. It not only lifts heavy parts to place without the risk attendant upon raising by hand, particularly in times of cold and wet, it also makes it possible to use much heavier members than could practically be raised by hand, and thus increases the amount of fabrication which can be done in the shop under cover."

The Hoover Committee outlines the developments in electrical power which eliminate many of the difficulties attending the operation of steam boilers under cold weather conditions. It points out that steam and electric hoists have eliminated many of the dangers of accidents so common when labor was used to carry heavily loaded hods up uncertain ladders. The Committee also remarks on the effective use of compressed air in building operations.

Continuing, the Committee reviews the progress of reinforced concrete in building construction as follows:

"The only other recent development which rivals structural steel as an improvement in building construction is that of reinforced concrete. Reinforced concrete was the subject of much experimentation in the eighties and nineties and came into general use between 1900 and 1910. It now competes with structural steel in practically all fields where the latter has been used, choice of the two materials depending on such factors as availability, cost of transporting materials, type of labor supply adaptability to special purposes, or personal preference. Building with concrete essentially is more subject to climatic handicaps than with structural steel, but an elaborate tech-

Contract awarded Taylor Mayer, Keystone Building, Pittsburgh, Pa., without competition.

Hotel Lafayette, North Carolina, near Pacific avenue, Atlantic City, N. J. Architect, W. Macy Stanton, 1524 Chestnut street, Philadelphia. Owner, care of architect. Brick, stone, steel, concrete, fireproof, 10 stories, 175 rooms, steam heat, oil burning equipment, tile and marble work, slag roof, concrete floors, elevators, rolled steel sash, hollow metal doors, iron work. Plans in progress. Contract awarded Charles P. Tilton, Atlantic City, N. J., without competition.

Bakery, Newark, N. J. Architects, Seeburger & Rabenold, 1524 Chestnut street, Philadelphia. Owners, Drake Bakeries, Inc., Newark, N. J. Reinforced concrete, brick, steel, 4 stories and basement, 100x126 feet (plumbing, heating, electric, elevators reserved), slag roof, cement floors, ornamental iron work. Contract awarded Thompson & Binger, 103 Park avenue, New York.

Residences (12), 3041-63 Carman street, Camden, N. J., \$69,600. Architect, private plans. Owners, Sharp Holding Co., Camden, N. J. Brick, 2 stories, 18x32 feet, slag roof, hot water heating, electric lighting. Contract awarded to Davis Bros., 901 North Thirty-first street, Camden, N. J.

Residences (2), 334-336 North Fortieth street, Camden, N. J., \$8,000. Architect, private plans. Owner, Kate Bentley, Camden, N. J. Frame, 2 stories, 15x38 feet 6 inches, slag roof, warm air heating, electric lighting. Contract awarded to Robert T. Williams, 512 North Seventh street, Camden.

Building, 1301 Walnut street, Camden, N. J., \$2,000. Architect, private plans. Owners, Himmelein & Bailey, Camden, N. J. Block, 1 story, 23 feet 7 inches x 40 feet, slag roof, electric lighting. Contract awarded to Lewis T. West, Fifth and Royden streets, Camden, N. J.

Miscellaneous Construction News

School, Beverly, Kentucky. Architect, C. J. Lappley, Ebner Building, Harrisburg, Pa. Owners, Red Bird Settlement, Rev. J. J. De Wall, Beverly, Ky. Frame, 2 stories, 160x112 feet, shingle roof, maple floors, electric light. Plans in progress.

Residence, Newark, Del. Architect, A. L. Ward, Stephen Girard Building, Philadelphia. Owner, Ernest B. Wright, care of architect. Brick, stone, 2½ stories, 40x100 feet, slate roof, hardwood floors, Spence heater, electric light, tile and marble work (5 baths). Architect taking bids due November 1st.

Residence (alts.), Holly Oak, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, Paul Hessler, Holly Oak, Del. General interior alterations. Plans in progress.

Garages (9), Sixth and Lincoln streets, Wilmington, Del. Architect, private plans. Owner, Nicholas Fidance, 1612 West Fourth street, Wilmington, Del. Brick and block, 1 story, 10x18 feet, slag roof, concrete floors. Permit granted.

Miscellaneous Contracts Awarded

Manufacturing Building, near Johnson City, Tenn. Architects, Lockwood-Greene Co., 1 Pershing Square, New York City. Owners, American Bernberg Co., Johnson City, Tenn. Brick, steel, 1 story, 644x246 feet, slag roof, cement and wood floors, electric light, rolled steel sash. Contract awarded Hughes-Foulkrod Co., Commonwealth Building, Philadelphia.

Residence, Louisville, Ky. Architect, C. A. Ziegler, 1012 Walnut street, Philadelphia. Owner, Brent Arnold, Louisville, Ky. Stone, 2½ stories, 35x90 feet, shingle roof, hardwood floors, vapor heat, electric light, tile and marble work. Contract awarded Palmer Graham, Louisville, Ky.

Dairy (add.), Wilmington, Del., \$5,500. Architect, private plans. Owners, Clover Dairy Co., Twelfth and Orange streets, Wilmington, Del. Brick, 1 story add., 27x79 feet, slag roof, concrete floors. Contract awarded to Reed Brothers, 702 Orange street, Wilmington.

Manufacturing Building, Wilmington, Del. Architect, Clarence E. Wunder, 1520 Locust street, Philadelphia. Owners, Topkis Brothers Co., 217 French street, Wilmington, Del. Brick, reinforced concrete, steel, cut stone, 4 stories and basement (plumbing, heating, electric, elevators, sprinkler separate bids), slag roof, cement and maple floors, hollow tile, cainting and glazing, rolled steel sash, fire and kalamein doors, bond, ornamental iron work, metal toilet partitions, elevator doors. Contract awarded J. A. Bader Co., Lackey Building, Wilmington, Del.

Apartment Houses (7), Coral Gables, Fla., \$3,000,000. Owners, Coral Gables Co., Coral Gables, Fla. Cinder block and stucco, 3 stories, 230x150 feet, electric light, tile roof, oak and pine floors, tile work, ornamental iron work. Plans nearly completed. Contract awarded J. P. Hallahan, 2313 Walnut street, Philadelphia.

Operation of Apartment Houses and Residences, Coral Gables, Fla., \$1,500,000. Owners, Coral Gables Co., Coral Gables, Fla. Concrete block and stucco, 2½ and 3 stories, various sizes, tile roof, oak and pine floors, electric light, tile work, ornamental iron work. Plans in progress. Contract awarded Nelson Pedley Const. Co., 1510 Chestnut street, Philadelphia.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 23, 1925.—SEALED PROPOSALS will be opened in this office at 3 P. M., November 30, 1925, for construction (except mechanical equipment) of buildings for the Federal Industrial Institution for Women for the Department of Justice at Alderson, W. Va. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms, or corporations possessing satisfactory financial and technical ability, equipment, and organization to insure speedy completion of the contract, and who have established a record for execution on contracts of similar character and magnitude. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 676)

nique of preparation and protection has been developed which makes the former practically as independent of the weather as the latter, and far more suitable for cold weather construction than many older combinations of materials. More than any other construction type, it has been fruitful of new equipment and methods which apply also in other fields of work, and has thus been both directly and indirectly influential in extending the construction season."

Even the concrete mixer, we read, has only been in common use since about 1900, and the point is made that if it were not for mechanical mixing of concrete, it would be highly uneconomical to use in winter weather, since by the machine process, heated materials are given but a fifth of the time to cool that they would undergo in hand mixtures. Reinforcement steel is now usually cut and bent at the mill and delivered to the job ready for placing. This feature further lessens the handicap of winter construction.

HOW CONTRACTORS DEFEAT COLD WEATHER

Nearly all plastic materials such as concrete, mortar, or plaster must be protected from freezing. There is no danger of unsatisfactory results in using such materials in cold weather if they are adequately protected against freezing temperatures for a few days.

Engineering News-Record says:

"Winter methods in construction are operations especially directed toward reducing exposure and eradicating frost. They are increasing frost resistance, thawing and removing snow and ice, heating and insulating forms, blanketing exposed surfaces, housing, heating enclosed spaces.

"Addition to concrete of certain compounds such as salt, to lower the frost point or calcium chloride to quicken setting, is effective where only a few degrees of frost have to be guarded against. In general these chemical hardeners have a field limited to isolated small operations or especially thin sections or slabs at temperatures, let it be repeated not much below freezing."

When very severe cold weather is to be encountered more effective methods must be used to insure against damage by frost action. Not only must the mixing water be heated but the fine and coarse aggregates as well. Further, in very severe weather the slight insulation provided by a light covering of hay, sawdust or burlap will not be sufficient. The work must be covered and supplied with artificial heat under the covers from salamanders, boilers or some other reliable source of heat.

The Turner Construction Company of New York has done many millions of dollars worth of concrete construction during the severe New England winters and their requirements for cold weather construction are published in *Engineering and Contracting*. An extract from the article follows:

"Winter work has been a regular procedure for contractors experienced in reinforced concrete construction for many years. Such contractors have found that it is necessary to supply proper protective equipment, but less experienced contractors do not always realize the danger resulting from lack of proper protection. The use of a definite specification is necessary if the owner is to have reasonable assurance of getting an undamaged building at the completion date contained in the contract.

Cold Weather Protection for Reinforced Concrete Work

"(1). The contractor shall furnish and install at the building boiler capacity of at least 50 h.p. licensed for 80 pounds steam pressure. This boiler capacity shall always be available for the sole purpose of supplying steam for cold weather protection.

(2). All fine and coarse aggregate shall be entirely freed from frost and warmed either by storing in an enclosed space properly heated or if not stored in an enclosed heated space then by piling over perforated steam pipes, having a diameter of 1½-in. and spaced about 4 ft. C to C or shall be heated by inserting 1½-in. perforated pointed steam pipes into the pile. The material piles shall be steamed during the day preceding the placing of concrete and while concreting and shall be covered with canvas during the night preceding the placing of concrete.

(3). All mixing water shall be heated

by injecting live steam into the water barrel at the mixer through a pipe at least 1½-inch in diameter.

"(4). A steam line shall be carried up with the form work and immediately before starting to place concrete all forms and steel reinforcing shall be thoroughly cleaned and warmed by live steam supplied through a steam hose.

"(5). Before starting to concrete the columns of any story or the floor supported by such columns, the contractor shall hang canvases to enclose the section of the story to be concreted being careful to maintain an air space between the exterior faces of the concrete and the canvas curtains. Canvas curtains shall be well lapped to exclude wind and shall be large enough to reach below the surface of the floor supporting the columns which are to be concreted.

"(6). Before starting to place concrete, salamanders containing coke fires shall be placed inside the enclosure at proper intervals to maintain a temperature of about 70 deg. at the under side of the floor slab. This will generally require about one salamander of usual size to each 300 sq. ft. of floor space. One salamander shall be placed near each exterior column unless temperature is below 20 deg. when two salamanders shall be placed on each side of each exterior column. On windy days use two salamanders at each exterior column on windward side of building.

"(7). Holes about 8 in. by 12 in., one to about every 300 sq. ft., shall be formed through the floor slab by cutting holes in the floor form and inserting a wood frame in the concrete. These holes

LIME SLAG

PLASTERING MATERIALS

TERRA COTTA PIPE

to be made larger at the top of the slab than at the bottom of the slab in order to hold the concrete which will later be used to fill them. These holes permit hot air to rise into the space between the top of the slab and the canvas covers described in the next paragraph.

"(8). As rapidly as the floor slab is concreted it shall be covered by canvas covers well lapped and supported about 6 in. to 18 in. above the surface of the concrete by a framework supported on the wood frames around the heat openings or on the steel reinforcing rods which project above the floor line at columns. These top covers shall be well lapped over the side curtains.

"(9). Full continuous heat is to be maintained in each section for 110 hours after the concrete is poured, except should the outside temperature fall below 20 deg. F. the heating shall be continued for one day for each day on which the temperature falls below 20 deg., but not to exceed two additional days of 24 hours each.

"(10). When using beam and girder construction top covers shall be kept in place for 48 hours, but with flat slab construction they shall be kept in place for 72 hours except that top covers may be removed between 8 a. m. and 5 p. m. on days when the temperature is above 35 degrees to permit of setting column forms, but shall be replaced at 5 p. m.

"Side covers shall remain in place as long as heat is continued except that after 48 hours the curtains outside of exterior columns may be removed one at a time for only sufficient time to strip the forms from the exterior columns after which they should be immediately replaced."

There are other satisfactory ways of heating aggregates and water than those described in the Turner Company Specifications. Aggregates can be heated to very good advantage by storing them in bins constructed so that steam pipes can discharge live steam into the aggregates around the bottom of the bin and over the discharge opening. In this way aggregates may be kept hot as they are delivered to the mixer. Instead of heating water by discharging live steam into a water barrel or storage tank it can be heated by passing it through a boiler or in a heater designed for the purpose.

The technical press and builders' journals contain many striking examples of important structures erected during the winter months in our Northern cities. A January drive through the outskirts or suburbs of Detroit, Chicago, New York City or any large city will show that residential building does not halt for snow and ice.

The Northern Ontario Building, situated right in the heart of Toronto's financial and office district, is not only the

highest concrete building in the British Empire, but architecturally is one of the the most beautiful office buildings in Toronto. *Municipal Improvements* says of this building:

"It was completed within nine months of the first excavation, the work being carried on all through the rigorous winter months.

"On October 23, preliminary excavation was under way and was practically completed in two weeks elapsed time. By November 13, pouring the concrete for the foundation walls was progressing rapidly and a placing tower had been erected and pushed with especial vigor, so that by December 4 operations were being carried on well above street level.

"Here King Winter began to assert himself without, however, impeding in any way the progress on the structure. Tarpaulins were called into use to protect fresh concrete from cold and snow and other unusual precautions were taken to guard against the effects of low temperature. An average of practically a story a week was made in the dead of winter."

When fire swept away an important wing of the "Chateau" at Lake Louise, Alberta, in the fall of 1924, officials of the Canadian Pacific Railway in charge of the resort realized that no time could be lost in erecting the new 10-story building with 300 rooms to accommodate the next summer's "rush" of tourists. In describing the work, *Railway Age* says:

"To permit concreting to proceed without interruption during the winter an outside boarding was erected around the entire building, approximately five feet away from the building line; this consisted of 2 by 8-inch studs spaced at 33 inch centers in the lower stories and 2 by 6-inch studs in the upper stories. These were capped, strutted and tied to the steel spandrel beams at each floor level and were sheeted on the outside with common boards and lined inside with sheeting of heavy tar paper cleated to the sheeting and studs. Cheese-cloth windows were left at frequent intervals to give some natural light, although artificial light was used both day and night for construction work.

"Heat was supplied to this enclosure from a central heating plant through temporary steam coils placed on the walls to offset outside temperature as low as 50 deg. below zero."

WHAT SAFETY REALLY MEANS

There are people who think that the safety movement is being conducted by fanatics who are trying to take the joy out of life by impressing everybody with the perils that constantly confront us. This is a wrong conception. There is no doubt but what life would be a ter-

ribly sad existence if adventure were eliminated. The idea that inspires the safety leaders of the nation, however, is to educate our people to meet dangers consciously and intelligently. He who leaps in the "dark of some sharp accident" and takes a "mitigable chance" only wastes an unadventured soul."

The enthusiastic accident preventionist will admit that danger and risk are fundamental to life and that the adventure of life might be tame without the possibilities of chance or mishap. The mechanical age has only accentuated the innumerable possibilities of accidents. In spite of these common dangers and the growth of them, only suicides willingly give up life. There is no inconsistency with living a joyous adventurous life and at the same time respecting these dangers.

In a recent statement W. H. Cameron, managing director of the National Safety Council, which is conducting a perpetual accident prevention campaign, points out that no sane person would cut a hole in the floor, or leave such an opening unguarded, just for the fun of falling into it and breaking a limb. It is the holes in factories, on the streets, on pavements and in our homes that the safety man wants covered up. Thousands of factories have accidents that can be prevented through the elimination of the causes which are common in every industry.

There will always be accidents, admits Mr. Cameron, but a great many tragic deaths and long lingering sufferings can be avoided through the exercise of due care which will follow the necessary educational work along this line. Safety does not mean cowardice. Precautionary teaching does not necessarily result in the development of a fear "complex." The right kind of safety means constructive conquest, not timid submission.—*The Associated Contractor*.

CAPTAIN ALBERT F. BROWN, A DELEGATE TO WATERWAYS' ASSOCIATION CONVENTION

Captain Albert F. Brown, President of the Philadelphia Transportation and Lighterage Co., the Pioneer Sand Dredgers of Delaware River Bar Sand, has been appointed Delegate to the 18th Annual Convention of the Atlantic Deeper Waterways' Association to be held at Miami, Florida, November 23rd, representing the State of Pennsylvania, the City of Philadelphia, The Vessel Owners' and Captains' Association of the Port of Philadelphia and The National Board of Steam Navigation.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

##

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

**"No hot water fo' mah dishes---
we surely needs one o' dem Tank Heaters."**

IT IS exasperating to the cook when somebody takes a bath before supper and leaves her in the lurch on the hot water question. The least a good cook or a good laundress can ask for is **PLENTY OF HOT WATER**, and it is so easily and so cheaply supplied with a

The Tank Heater
will give plenty of
hot water all the
time.

NOVELTY TANK HEATER

Less than a bucket of pea coal or buckwheat coal in 24 hours keeps this little heater right on the job day and night—and the 40-gallon tank stays full of hot water. A minute's attention morning and evening is all that is necessary and the operating cost is but 5 cents a day—one-quarter as much as gas. (This is unprejudiced, for we make both kinds.)

We were the originators of this type of coal tank heater and there are now imitations. Install the **NOVELTY**, with its brick-lined fire-pot, baffled water-way, two-bar rocking grate and reinforcement rods at the sides. Look for the name on the door. In these days of many baths, the average household wants a **BIG** supply of hot water—a **FORTY GALLON** tankful constantly on tap. The **Novelty** is designed for this.

Get all the facts—now! Write or phone today for complete information. "Hot Water and Plenty of It." Address Dept. BG-11.

Knickerbocker NEAT (Red Tag) Used Exclusively

ARCHITECTS and builders everywhere are now specifying and using Knickerbocker NEAT on most of their operations because it is the most economical plastering preparation procurable.

It has great sand carrying capacity and produces a mortar that will harden in less time than when old-fashioned lime is used.

Knickerbocker NEAT is the result of years of research and practical experience and is produced in a modern plant, one of the largest east of the Ohio River.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 23, 1925.—SEALED PROPOSALS will be opened in this office at 3 P. M., November 30, 1925, for construction (except mechanical equipment) of buildings for the Federal Industrial Institution for Women for the Department of Justice at Alderson, W. Va. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms, or corporations possessing satisfactory financial and technical ability, equipment, and organization to insure speedy completion of the contract, and who have established a record for expedition on contracts of similar character and magnitude. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., October 30, 1925. Sealed Proposals will be opened in this office at 3 P. M., November 30, 1925, for the mechanical equipment of buildings, and outside services, at the Federal Industrial Institution for Women, for the Department of Justice at Alderson, W. Va. Draw-

ings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms or corporations possessing satisfactory financial and technical ability, equipment and organization to insure speedy completion of the contract, and who have established a record for expedition on contracts of similar character and magnitude. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations.

tions. James A. Wetmore, Acting Supervising Architect.

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the installation of the electrical work and heating and ventilating of the Senior High School Building to be erected on the plot of ground lying at the northwest corner of West College Avenue and South Beaver street, York, Pa. The proposals must be submitted separately for the Electrical Work, and Heating and Ventilating—all in accordance with plans, drawings and specifications prepared by John B. Hamme, Registered Architect, York, Pa. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders.

Plans and specifications may be secured from David N. Crider, Secretary of the Board of Directors, in the Central School Building, corner of West King Street and Cherry Alley, York, Pa. A deposit or certified check for \$50 must accompany applications for each set of the Electrical Work, or Heating and Ventilating plans and specifications, \$35 of which will be returned for each set when plans and specifications are returned accompanied with a bid.

In case no bid is received the entire amount of the deposit or check will be forfeited.

On or about Nov. 9, 1925, plans and specifications will be delivered to persons making application in accordance with the above requirements. Plans and specifications will be on view in the office of John B. Hamme, Registered Architect, Citizens' Savings and Trust Building; in the office of M. O. Lewis, Superintendent of Buildings and Grounds, in the Central School Building, York, Pa., and at the Builders' Exchanges in Philadelphia, Pa., and Baltimore, Md.

All bids must be signed, sealed, properly marked with name of contract bid upon and delivered to David N. Crider, Secretary, Central School Building, York, Pa., not later than 1 o'clock P. M., of Friday, November 20, 1925. All proposals received after the time advertised for receiving bids will be returned unopened.

The right is reserved to reject any and all bids.

EDWARD W. NEUMAN,

Chairman of the Committee on Buildings, Grounds and Fuel, of the Board of School Directors of the School District of the City of York, Pa.

CERTIFICATES FOR CRAFTSMANSHIP ISSUED

Philadelphia Building Congress Makes First Award

The first fall meeting of the Philadelphia Building Congress was a memorable one. At a dinner in the City Club, attended by all elements in the building industry, with many of the recipients present in person, the Committee on Awards, after reviewing nominations received through the co-operation of architects and others qualified to pass upon the work performed during 1924, awarded certificates to individuals and firms as follows:

Guildsmen—To those engaged in the Crafts, who have shown especial skill in developing the artistry or handicraft possibilities in their particular field of work, such as designing, laying off, modeling, carving, wroughtwork, and have given visible evidences of individuality—a Certificate as a Guildsman—was awarded to:

J. H. Dulles Allen—Tiles and Pottery

John Barber—Woodworking and Furniture.

Nicola D'Ascenzo—Stained and Leaded Glass.

Carl Dubs—Woodworking and Furniture.

Edward Maene—Sculpture, Modeling and Carving.

John Maene—Modeling and Wood Carving.

Hollingsworth Pearce—Metal Work.

William A. Schaefer—Wood Carving.

Max Voight—Plastic Arts.

William J. Voight—Plastic Arts.

Samuel Yellin—Iron Work.

William A. Zimmerman—Metal Work.

Craftsmen—To those, now designated by various names, such as Mechanics, Artisans, Skilled Workers, etc., who in any building craft have shown skill, ability, efficiency, willingness and the desire to improve their own knowledge and technique as well as that of fellow workers, helpers or apprentices—a Certificate as a Craftsman—was awarded to:

John Campbell—Steam Fitting.

Oliver A. Cromwell—Stair Building.

Fred Guenther—Foremanship in Building Construction.

Charles Haberle—Slate Roofing.

Charles H. Leader—Tile Setting.

Harry F. Leslie—Foremanship in Building Construction.

Louis Rieco—Stone Masonry and Brickwork.

Lew Smith—Foremanship in Building Construction.

Builders and Sub-Contractors—To those, who have satisfactorily either erected buildings or other structures or parts thereof, or installed equipment therein, and have encouraged pride of craft on the part of co-workers and have given individual recognition of it when deserved—a Certificate as a Co-operating Master Craftsman—was awarded to:

Lorenzon Brothers—Stone Masonry and Brick Work.

A Wilt & Sons Co.—Millwork and Cabinet Work.

Wm. Moore Co.—Tilework and Slate-work.

Wesley Sloan—Tilework and Slate-work.

F. A. Black & Co.—Painting and Decorating.

D. R. MacGregor Sons—Painting and Decorating.

Harry H. Rudolph—Painting and Decorating.

D. Knickerbacker Boyd, Architect, President of the Congress, was the presiding officer, and inspiring addresses were given by H. L. Duhring, Architect, representing the T-Square Club, Wm. D. Hill, Secretary, Philadelphia Chapter Associated General Contractors, Charles E. Billen, Secretary, Engineers Club, Peter Gray of the Cut Stone Contractors Association, James O'Neill, Secretary, Bricklayers' Union, John T. Brosman, President, Master House Painters Association, F. M. Venzie, of the Plastering Contractors Association, Vernon Fletcher, Secretary, Brotherhood of Carpenters, Edwin L. Seabrook, Secretary, Roofing and Sheet Metal Contractors' Association, J. W. Pearce, Metal Lath Club, Allen D. Cornell, General Contractor, and others.

Telegrams and letters of congratulation and commendation and wishing the recipients continued success were read from Stephen F. Voorhees, President, New York Building Congress, W. Stanley Parker, Boston Building Congress, F. H. Murphy, President, Association of Building and Construction of Oregon, Dwight L. Hoopingarner, Executive, American Construction Council, Paul A. Davis, President, Philadelphia Chapter American Institute of Architects, and from the Presidents of the Chamber of Commerce, the Real Estate Board, the City Club and other organizations.

The purpose of these Certificates is to encourage and to preserve in Philadelphia and its metropolitan area the true spirit of craftsmanship; to give recognition to those whose skill, patience and toil have builded well in the community.

An interesting feature in connection with some of these awards is that they accord with a popular vote cast on ballots provided for the purpose and distributed to visitors at the recent Exhibition of Architecture and Allied Arts held in the new Art Museum at the head of the Parkway.

The Certificates are in themselves a work of Art, having been designed by George Howe, of the firm of Mellor, Meigs and Howe, Architects. After December 31st, the Committee will begin consideration of awards for 1925.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

Indemnity Insurance Company of North America
write practically every form of insurance except life

"ANTI-HYDRO" Keeps a River Out of This Power House

The concrete foundations of this building are below the water level of the river that flows beside it. Nevertheless, the basement and boiler room are always dry, because the concrete is permanently water-proofed with "ANTI-HYDRO."

"ANTI-HYDRO" is an easy-to-use liquid integral compound that both hardens and waterproofs in one operation. It mixes with the gauging water without the aid of skilled labor. It is very economical to use and results are guaranteed permanent.

For 21 years "ANTI-HYDRO" has been repeatedly specified and used by leading architects, engineers and contractors the country over. Use it on your next job.

As The Editor Sees It

STANDARDIZATION OF ACCI- DENT STATISTICS AND THEIR VALUE IN CONSTRUCTION WORK

By F. A. Davidson, Safety Engineer

Whenever the popular cartoonist turns his hand to the construction industry we find him almost invariably indicating his size-up of the situation by portraying a poor worried individual staggering under the weight of many burdens, which tax him almost beyond endurance. This representation with occasional variations has become commonly accepted by construction men as expressing perfectly the present plight of their industry.

The loads which retard the progress of and weigh down so oppressively on our friend in the picture representing the construction industry are of various sizes and are variously labelled. Deciphering the labels we find among others "Shortage of Materials," "Rising Wages," "Transportation Difficulties," "Underproduction" and "High Liability Insurance Rates." Nor do we find the last named caption marking by any means the smallest of the burdens.

Moreover, no well-informed observer is surprised at finding liability insurance depicted as one of the substantial burdens bearing down on the construction industry today. For if a penalty amounting on the average to approximately four

or five per cent of the payroll expenditure is defined as anything less than a serious handicap in any industrial pursuit in which manual labor is such an outstanding factor, as is the case in the construction industry, then it is not properly described. It is true, to be sure, that at the present time some of the other discouraging elements mentioned weigh perhaps more heavily. It is true also that in our habits of thought and speech we tend to follow a certain fashion. At the moment "Shortage of Materials," "Rising Wages" and so forth are fashionable terms. In attempting to solve our problem of today, namely, high costs, we cannot afford to overlook a single factor. Is it not possible that by focusing our attention exclusively on certain fashionable ills which beset us we may overlook the importance of this item of insurance which relentlessly, persistently, day after day, in season and out, goes on swelling our cost figures, a constant tax on all our operations?

Although sums expressed in terms of percentage have a way of sounding small, every construction man who has checked over an estimate will agree that the allowance demanded by insurance looked amazingly large. Most jobs in these days on which the payroll expenditure is not over one hundred thousand dollars, are regarded as small jobs. Yet what builder with an operation involving a payroll of this sum has not coveted the four or five thousand dollars which he is obliged to pay for his liability insurance. Naturally,

on the larger undertakings the sums spent for this purpose are more impressive. On a job with a million dollar payroll the insurance bill may be in the neighborhood of forty or fifty thousand dollars. If we were to total these increments paid out in connection with all contracts large and small throughout the whole country, needless to say we should find that the yearly cost of liability insurance to the construction industry reaches a startling figure.

It is sometimes said that this charge is passed on to clients and owners. The point is made that even if it were possible to avoid this item of expense no part of the saving would be retained by members of the construction industry. Therefore, why need we be concerned about it? We cannot argue along this line if we are alert to our own best interests. In our chosen field our livelihood depends on obtaining work. It is common knowledge that those who contemplate improvements are postponing their execution just as far as possible, deterred by high costs. Estimates are weighed most carefully and often the decision to go ahead or to hold off is determined by a very narrow margin. Certainly it is a fact that any possible saving of the sums mentioned above would look just as attractive to the investor as to the builder. It is unquestionably true that any reductions in cost which it might be possible for the construction industry to make, would be reflected in an increase in the volume of new construction business.

Many Problems Beyond Scope of Construction Field

Surveying the field once more to try and pick out a point to hammer down the costs we observe that many of the problems are beyond the scope of the construction field. Indirectly, of course, builders can help some in removing the obstacles imposed by the present insufficient transportation facilities. But in the main, the construction industry will have to depend upon the efforts of those responsible for the management and operation of the railroads for the removal of the burden imposed upon it by transportation difficulties. In general, the same thing may be said with reference to the handicap imposed by the scarcity of materials.

On the other hand, in the case of the burden of liability insurance the construction industry does not have to depend upon assistance from any other quarter. This is a matter which is strictly within its own province. Is it not logical, therefore, in attacking high costs to devote some earnest attention to that item which is not only recognized as a serious burden, but also as a factor for which the construction industry alone is responsible.

What is the real character of this problem of liability insurance? Have we not sometimes fallen into the way of thinking that insurance partakes of the nature of time and tide, in that it is something quite beyond human control? Yet, fundamentally, our liability insurance is simply a question of the number of accidents which occur on construction work. If we have a relatively large number of accidents we are obliged to pay a rela-

tively high insurance premium. If accidents tend to decrease, our insurance rates will be reduced. Thus, the insurance problem resolves itself into a problem of accident prevention.

To those who have followed the progress of the Safety Movement it is an old story how industry after industry has achieved amazing results in reducing accidents. Reductions of fifty, seventy, and ninety per cent have become the common occurrence, and have demonstrated absolutely that accidents can be definitely brought under control.

Construction Lagged Behind in Safety Movement

Unfortunately construction has lagged behind the other groups in recognizing the possibilities in, and the valuable results to be obtained from a whole-hearted participation in the Safety Movement. Possibly the age-old notion: "Our business is different," explains one reason for our backward position. However, there is no reason for believing that the modern principle of accident prevention cannot be as successfully applied in construction as in other lines. Methods of application may be modified, but the principle is fundamentally sound and properly applied will certainly yield just as good results as have been obtained so widely in other industries.

As a matter of fact, the plan of applying a thorough-going safety program on construction companies has been proven beyond question to pay. Those who have attended previous meetings of this body recall the astonishing savings in insurance costs which representatives of these companies were able to show me in describing the accident prevention methods employed by their organizations.

Nevertheless, while a few progressive companies have accomplished splendid results in cutting down their individual costs, the co-operation of the whole industry is necessary in order to achieve the benefits of lowered costs on a large

Decorating Masonry Walls

THE TRUSCON LAB

You could
dip this
house in
water

BOOKLET ON

Cracking, spalling and general disintegration of concrete
caused by absorption of water. Masonry can be
dampproofing the surface.

STONETEX is the masonry coating. Not only does it
prevent water from being absorbed into concrete, stucco or brick,
but it gives the surface with a beautiful finish which lasts for years.
It does not produce the "shiny" appearance of paint
on masonry.

ing Green Golf Course, Chester, Pa. Brick, hollow tile, stucco, stone, 2 stories, 1 story and basement, 168x40 feet, two buildings, 23x40 feet, 1 story, variegated slate and shingle roof, pine and cement floors, plumbing, electric light, metal lath, tile work, ornamental iron work, caulking, everlasting floors, cut stone, flagstone, wrought iron pipe. Lowest bidder, William Provost, Jr., of Chester, is taking revised sub-bids.

Residence, Swarthmore, Pa. Architect, J. Warren Neff, 219 North Broad street, Philadelphia. Owner, F. Herbert Evans, on premises. Concrete block and stucco, 2½ stories and basement, 26x36 feet, shingle roof, oak and pine floors, hot water heat, electric light, ornamental iron work. Architect taking bids due as soon as possible.

Road Work, Pennsylvania. Owners, Pennsylvania Department of Highways, Harrisburg, Pa. Low bidders:

Venango-Crawford Counties, R-89, A-3679-3710, Oil Creek Township, 18,922 feet. One course reinforced concrete. H. E. Bunce, Olean, N. Y., \$90,929.29, \$118,483.99.

Lycoming County, A-3603, Picture Rocks Borough, 1,411 feet. One course reinforced concrete. Winston & Co., Harrisburg, Pa., \$12,822.50.

Crawford County, R-82, West Fallowfield Township, 1,090 feet. Grading and drainage. O. B. Braecht, Titusville, Pa., \$17,725.31.

Westmoreland County, A-3632, Unity Township, 11,785 feet. One course reinforced concrete. Thomas Cronin Co., Pittsburgh, Pa., \$93,177.59.

Bradford County, R-241, Sec. 3, 29,827 feet, Standing Stone and Wysox Townships. One course reinforced concrete. Bryant & Kohl, Wilkes-Barre, Pa., \$354,094.50.

Westmoreland County, A-3592-3633, Unity Township, 10,102 feet. One course reinforced concrete. Thomas Cronin Co., Pittsburgh, Pa., \$67,552.75.

Washington County, R-268, S-9, East Pike Run Township, 1,820 feet. One course reinforced concrete. T. W. Munro Const. Co., Tarentum, Pa., \$30,725.95.

PENNSYLVANIA

Contracts Awarded

Residence and Garage, Ithan, Pa. Architects, McIlvaine & Roberts, Otis Building, Philadelphia. Owner, Noah H. Swayne, Ithan, Pa. Concrete block and stucco, 2½ stories and basement, garage, 61x30 feet, residence, 81x30 feet, slate, slag and shingle roof, cement, oak and pine floors, plumbing, hot water heat, electric light, metal lath, tile work, bond, ornamental iron work, septic tank, metal corner beads, flagstone. Contract awarded Metzger, Fisher & White, Otis Building, Philadelphia.

Boiler Plant, Norristown, Pa. Architect, W. E. S. Dyer, Land Title Building, Philadelphia. Owners, Norristown Woolen Mills, Norristown, Pa. Brick, steel, 1 story, 26x38 feet, asphalt gypsum roof, cement floors, painting and glazing, plumbing, hollow metal sash, bond, ornamental iron work. Contract awarded Frank Schuler, Norristown, Pa.

Garage, Drexel Hill, Pa. Architects, MacKenzie & Wiley, Bankers' Trust Building, Philadelphia. Owner, name withheld. Brick, 2 stories, 55x90 feet, slag roof, cement floors, concrete work, electric light. Contract awarded George P. Gehring, 5735 Warrington avenue, Philadelphia.

Trainer's House, Whitmarsh, Pa. Architect, Horace Trumbauer, Land Title Building, Philadelphia. Owner, George D. Widener,

Whitmarsh, Pa. Stone, 2 stories, 87x31 feet, slate roof, oak and pine floors, hot water heat, electric light, metal lath, ornamental iron work. Contract awarded D. W. Sperry, Jefferson Building, Philadelphia.

School, Annville, Pa. Architect, E. Z. Scholl, 136 Robeson street, Reading, Pa. Owners, Annville School Board, care of architect. Stone, steel, 2 stories, 150x40 feet, slag roof, wood floors, roof ventilators, safety treads, ornamental iron, iron stairs, fire doors, skylights, tile work, metal lath (heating, plumbing and electrical work separate). Contract awarded to Saylor & Son, Annville, Pa.

Residence, Reading, Pa. Architect, F. A. Muhlenberg, Ganster Building, Reading, Pa. Owners, C. Evans' Cemetery, Reading, Pa. Brick, 2 stories, 24x35 feet, slate roof, oak floors, hot water heat (plumbing, heating and electrical work reserved). Contract awarded to Charles H. Schlegel, 2250 Perkiomen avenue, Reading, Pa.

School Building (add.), Wilkes-Barre, Pa., \$22,000. Architect, J. A. McGlynn, Simon Long Building, Wilkes-Barre, Pa. Owners, Wilkes-Barre Township School District, John J. Kerrigan, secretary, 641 East Northampton street, Wilkes-Barre, Pa. Brick and hollow tile, 2 stories add., 31x27 feet. Contract awarded to Alaimo Brothers, Newrose Build-

ing, Pittston, Pa. Heating, R. A. Curley, 698 Hazel street, Wilkes-Barre, Pa. Electrical, Thomas Syron, 196 Scott street, Wilkes-Barre, Pa.

Normal School (alts.), Bloomsburg, Pa., \$25,000. Architects, M. E. Kressley Co., Commonwealth Building, Harrisburg. Owners, Bloomsburg State Normal School, Bloomsburg, Pa. General alterations, steam heat, electric light, metal lath, kalamein doors, store fixtures, bond, iron stairs, ornamental iron work, waterproofing, elevators, ventilators, hollow tile, composition roof, composition and mastic floors. Contract awarded to W. H. Cramer Const. Co., Emporium, Pa.

Residence (alts. and add.), Bethlehem Pike, Pa. Architect, Edward F. Hoffman, Jr., 315 South Fifteenth street, Philadelphia. Owner, Mrs. William Redwood Wright, on premises. Cinder block, cut stone, 1 story, 16x19 feet (plumbing, heating, electric reserved), shingle roof, pine floors, painting and glazing, tile work, ornamental iron work, flagstone, carpentry and mill work, linotile floors. Contract awarded Howard S. Amey, 532 Butler street, Philadelphia.

Residence, Shamokin, Pa. Architects, Muhlberg Brothers, Thompson Building, Pottsville, Pa., and Reading, Pa. Owner, H. K. Leader, Shamokin, Pa. Brick, 2½ stories, 48x48 feet, slate roof, hardwood floors, tile work (heating, plumbing and electrical work reserved). Contract awarded to Samuel Bilger, Shamokin, Pa.

Residences and Garages (C and D), Bryn Mawr, Pa. Architect, Francis E. Morewood, Bryn Mawr, Pa. Owners, Dolman & Co., Liberty Building, Philadelphia. Cinder block, stucco, stone, 2½ stories, 49x33 feet, garage, 21x18 feet, shingle roof, oak, pine and cement floors, plumbing, vapor heat, electric light, metal lath, tile work, bond, ornamental iron work, integral waterproofing, metal casements. Contract awarded Metzger, Fisher & White, Otis Building, Philadelphia.

Residence (alts. and add.), Bryn Mawr, Pa. Architect, R. Brognard Okie, 208 South Smedley street, Philadelphia. Owner, Dr. George W. Norris, on premises. Stone work, bluestone

or flagstone, cement and concrete, brick work, carpentry and mill work, maple and pine floors, plastering, metal lath, black slate roof, canvas floors, painting and glazing, iron work, hot air heat, electric wiring (plumbing reserved). Contract awarded M. N. Croll, Radnor, Pa.

Farm Buildings, near Broad Axe, Pa. Architect, R. Brognard Okie, 308 South Smedley street, Philadelphia. Owner, N. H. Seabreeze, Broad Axe, Pa. Frame, 1 story. Contract awarded Melvin H. Grebe, 5 East Highland avenue, Chestnut Hill.

John S. Sells Memorial Chapel, Elizabethtown, Pa. Architect, Edgar A. Wightman, Bankers' Trust Building, Philadelphia. Owners, Masonic Homes, Elizabethtown, Pa. Stone (Holmesburg granite), steel, cut stone, 1 story and 2 stories and basement, 88x52 feet, variegated slate roof, cement and maple floors, painting, Truseon waterproofing, ornamental iron work, floor hardener, bond, rolled steel sash, tile work, metal lath, reinforced concrete (Holmesburg granite, plumbing, heating, electric light, glazing, chimes, organ and seating reserved). Contract awarded Curtis Grindrod Co., 10 South Eighteenth street, Philadelphia.

Gymnasium, Scotland, Pa. Architect, R. A. Stair, Guardian Trust Building, York, Pa. Owners, Pennsylvania Soldiers' Orphans' Home, T. B. Wood, Scotland, Pa. 1 story, 36x121 feet, composition roof, electric light. Contract awarded to Charles Cump, Chambersburg, Pa.

Rockdale Bridge, No. 8, over Chester Creek. Architect, S. C. Hollister, Media, Pa. Owners, County Commissioners, G. T. Wades, Media, Pa. 2 span reinforced concrete arch bridge, approximately 329 feet long, to replace present steel bridge. Contract awarded D. B. Hoover, Pottstown, Pa., \$29,990.

Road Work, Pennsylvania. Owners, Pennsylvania Department of Highways, Harrisburg, Pa. Sullivan County, R-17, Sec. 7, Laporte Township, Cherry Township and DuShore Borough, 32,235 feet. \$337,949.00. Contract awarded to United Const. Co., Lock Haven, Pa.

24x35 feet, slate coated shingle roof, warm air heat, electric light, pine floors. Permit granted.

Manufacturing Building, Gloucester, N. J. Architect, Clarence Wunder, 1520 Locust street, Philadelphia. Owners, Forrest Mercery Co., on premises. Brick, steel, 2 stories and 1 story and basement, 100x33 feet, wing 34x33 feet, electric light, slag roof, pine floors, cement floors, ornamental iron work. Architect taking bids due November 12th.

Contract awarded P. H. Kelly, 1713 Sansom street, Philadelphia.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 23, 1925.—SEALED PROPOSALS will be opened in this office at 3 P. M., November 30, 1925, for construction (except mechanical equipment) of buildings for the

Federal Industrial Institution for Women for the Department of Justice at Alderson, W. Va. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms, or corporations possessing satisfactory financial and technical ability, equipment, and organization to insure speedy completion of the contract, and who have established a record for execution on contracts of similar character and magnitude. The fact that any concern obtains a set of the plans and specifications from any source whatever and submits a bid shall not constitute a waiver of the foregoing stipulations. Jas. A. Wetmore, Acting Supervising Architect.

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the installation of the electrical work and heating and ventilating of the Senior High School Building to be erected on the plot of ground lying at the northwest corner of West College Avenue and South Beaver street, York, Pa. The proposals must be submitted separately for the Electrical Work, and Heating and Ventilating—all in accordance with plans, drawings and specifications prepared by John B. Hamme, Registered Architect, York, Pa. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders.

Plans and specifications may be secured from David N. Crider, Secretary of the Board of Directors, in the Central School Building, corner of West King Street and Cherry Alley, York, Pa. A deposit or certified check for \$50 must accompany applications for each set of the Electrical Work, or Heating and Ventilating plans and specifications, \$35 of which will be returned for each set when plans and specifications are returned accompanied with a bid.

In case no bid is received the entire amount of the deposit or check will be forfeited.

On or about Nov. 9, 1925, plans and specifications will be delivered to persons making application in accordance with the above requirements. Plans and specifications will be on view in the office of John B. Hamme, Registered Architect, Citizens' Savings and Trust Building; in the office of M. O. Lewis, Superintendent of Buildings and Grounds, in the Central School Building, York, Pa., and at the Builders' Exchanges in Philadelphia, Pa., and Baltimore, Md.

All bids must be signed, sealed, properly marked with name of contract bid upon and delivered to David N. Crider, Secretary, Central School Building, York, Pa., not later than 1 o'clock P. M., of Friday, November 20, 1925. All proposals received after the time advertised for receiving bids will be returned unopened.

The right is reserved to reject any and all bids.

EDWARD W. NEUMAN,
Chairman of the Committee on Buildings, Grounds and Fuel, of the Board of School Directors of the School District of the City of York, Pa.

scale. The construction industry as a whole must adopt a vigorous well-planned program for eliminating all preventable accidents.

It goes without saying that the first step in such a program is a determination of the facts relating to accidents. In other words, the foundation of a successful drive against accidents must be reliable accident statistics.

Statistics is a much abused term. At a very sight of the word the average man pictures a dry meaningless mass of figures and looks about for the nearest avenue of escape. Yet the proper kind of statistics simply represent facts brought together in a logical form and tabulated in such shape that they may be properly studied and made to serve a useful purpose.

All construction companies should establish at once a systematic plan of keeping their accident records that will fit in smoothly and naturally with their regular procedure. In accordance with the requirements of the Workmen's Compensation laws, all accidents must be reported to the state authorities. Thus, it is necessary in any case to put on record the essential information relative to all accidents. Instead of merely filing this data in a pointless, unrelated fashion, it involves little if any extra time and trouble to record this same information in accordance with a definite orderly plan, so that the facts may be readily tabulated and used.

Advantages of Systematic Plan for Keeping Accident Records

Every company which adopts a systematic plan for keeping its accident records will find it of the utmost assistance in its efforts to prevent accidents on its own individual operations. First, it will show the chief executives the number of causes of accidents which are occurring. It will enable them to grasp clearly the waste and loss of efficiency which accidents represent. Only when the facts regarding accidents are presented in a more or less exact, concise form, instead of in a vague general way, can busy executives be reasonably expected to realize fully the importance of their accident problem and its significance bearing upon the well being of their employees and the productiveness of their business. The attitude of the chief executives of an organization toward accident prevention is reflected all down the line. Therefore, there exists the absolute necessity for them to have at hand the data upon which to base their judgment.

Second, clear-cut properly compiled accident records will show superintendents directly in charge of construction operations just how many accidents they are having and what causes are responsible

for them. Thus, they can direct remedies and know where to concentrate their efforts toward prevention. Such records are of course invaluable to men in any organization who may be assigned to supervise safety activities.

Furthermore, such records can be utilized to great advantage in attracting attention of foremen and workmen to accident prevention. Statistics may commonly be regarded as of little interest. Yet every day millions of Americans display the keenest interest in one set of statistics, and relative standings of the major league ball teams. The spirit of competition makes the cold hard figures glow with life. Different jobs or different divisions on the same job can be put on a competitive basis and their accident records compared. The figure can be arranged and displayed in an attractive way to appeal to that universal spirit of competition so that superintendents, foremen, and workmen will strive to produce an accident record which will compare favorably with that of other divisions and with their own past record.

But every one of the arguments that can be urged to induce all construction companies to keep systematic accident records in accordance with any method which may suit their various individual ideas applies with vastly greater force when it comes to appealing to all members of the construction industry to compile and tabulate their accident statistics in accordance with a standard uniform method. This means striking in unison at the very roots of the problem and ensures the maximum co-operation from the very start.

The advantage of standardizing accident statistics and having all construction companies tabulate their accident data in the same form are too self-evident as hardly to require stating.

This would be of value if for no other reason than that it would enable organizations to compare on the same basis their various accident records and let each one know how they stood with respect to others. The Dwight P. Robinson Company, for example, which the writer represents, might compile and as a matter of fact actually does compile accurate accident statistics and knows just exactly its accident frequency rate. Yet unless construction companies have compiled similar records on the same basis we cannot tell whether our record is better or worse than the average. We might believe it to be better, since we are obtaining the benefit of preferred insurance rates, but the actual fact of the matter is that without being able to compare it with the records of a sufficient number of representative companies of our own class to establish an average we are unable to know definitely just how we stand on the matter of accidents.

If we knew we did not stand as well as the average it would be powerful stimulus to improve our standing. If we found we stood above the average, it would be a matter of pride to us to retain and if possible extend our lead. There is no question but that the friendly rivalry that would thus be stimulated among various organizations would be of value in preventing accidents throughout the whole field. In a concern with a well developed *esprit de corps* it would simply be necessary to announce that a certain rival was able to do its work without as many accidents and all along the line the members of this company would become interested in the matter of bettering its accident experience.

But the real solid substantial argument for standardizing accident statistics and having all records on a common basis is that it would enable the combined accident experience of the entire construction industry to be readily analyzed in a scientific manner. Thus, in a very much shorter time than if each depended solely on his individual data, the principal hazards in the whole construction field could be fairly definitely ascertained.

Standard Safety Codes

The conclusion that it would be possible to draw from the impartial studies of reliable standard statistics would afford a sound basis for concerted action by the members of the construction industry. Such concerted action might be taken on various ways, as for example in the preparing of standard codes for construction work. Frequently construction men are heard to complain relative to the

provisions of certain state codes. But after all how can we expect to get the most intelligent laws designed to promote safety, unless those who draft them have a thorough knowledge of the facts, or in other words, are in possession of complete statistics. Or another way in which concerted action based on broadly gathered facts could accomplish what individual action could not is in the bringing of pressure upon the manufacturers of construction equipment to induce them to provide adequate guards on their devices at the source, that is, in their shops.

Again, if we have standard accident data compiled from many separate sources, it would make it possible for various valuable special investigations to be made in the way of scientific research having a great potential value. For example, it might eventually be possible to determine whether any definite relation and, if so, what relation exists between accidents and such other factors as overtime work, night work, labor turnover, industrial unrest, various types of construction and so forth?

Finally, many competent observers among insurance men are of the opinion that the classifications in the Compensation Insurance Manual relative to construction work are very much in need of revision. It is agreed that this can be done much more readily and intelligently after contractors have compiled accurate and comprehensive accident statistics.

Having agreed to the value in, and the necessity for the compiling of uniform accident records in construction, what are the practical steps required to bring about this standardization?

In the first instance, what are the records which should be regarded as essential? From the experience of other industries it may be stated with certainty that there are three distinct sets of data which all individual companies should tabulate. Every organization should compute first, its accident frequency rate; second, its accident severity rate; and third, should classify all of its lost-time accidents as to cause.

With respect to the first two mentioned there is little difficulty on agreeing upon a fixed standard. The basis of all accident frequency and accident severity rates is necessarily the amount of working time, which represents the amount of exposure to the risk of accident. Hence, since the working time varies, it is simply necessary to decide upon a common unit of time for measuring accidents. The best opinion on this subject is now unanimous in defining an accident frequency rate as an expression stating the number of lost-time accidents occurring in any specified period of time per each one million man-hours worked. An accident severity rate for a given period is an expression stating the number of working days lost,

due to lost-time accidents occurring in the period, per each one thousand man-hours worked.

Therefore, if the regular payroll figures of a company showed that during the past year their field forces worked 1,500,000 man-hours, while during the year there occurred on the work a total of 90 by 1.5. The quotient is 60. Hence, the accident frequency rate of this company for the past year is expressed as 60 lost-time accidents per each million man-hours worked.

In like manner if the above accidents caused a total loss of 6,000 working days the severity rate would be computed by dividing 6,000 by 1,500. The quotient is 4. Hence, the accident severity rate of this company for the past year is expressed as four working days lost per each thousand man-hours worked.

This, then, briefly shows the standard method of compiling accident frequency and severity rates which all construction companies should adopt. Table I and Table II (See page 593, Appendix B, Report of Statistical and Standardization Committee, Construction Section), display the standard forms which should be used in working up and recording this data. Any construction company whether or not a member of the National Safety Council that desires more detailed information relating to this method for computing their accident frequency and severity rates and to the proper uses of these forms can easily obtain it by writing to the headquarters' office of the National Safety Council, at Chicago.

Coming next to the third requirement that companies should tabulate as to cause all accidents involving lost time, we are at the present time facing a more difficult proposition. Table III shows the form which should be used in compiling this data. (See page 602, Appendix—Report of Statistical and Standardization Committee, Construction Section). Obviously, however, the maximum value would be derived from data of this character if it were possible for all companies to adopt a standard list of causes for use in classifying their various accidents. Needless to say it will require considerable study to develop such a table of causes that will be sufficient to meet all reasonable requirements without being at the same time too cumbersome. The co-operation of as many representative companies as possible is absolutely necessary to evolve a satisfactory solution.

Aims of Construction Section of N. A. C.

Fortunately for the construction industry a common meeting place for discussing and threshing out a matter of this kind is already established through the medium of the Construction Section of the National Safety Council. The development of such a standard list of causes for classifying accidents is one of

the official aims of the Construction Section. All of us who are members of the Section should exert every effort to induce as many progressive construction companies as possible to join the National Safety Council and sit in with us on this important matter. In any event, however, whether members of the National Safety Council or not, every construction organization in the interest of obtaining reliable accident statistics should classify all accidents in the manner shown in Table III on the basis of some suitable list of causes until such time as a uniform list has been agreed upon.

By way of recapitulation, then, we have sized up the situation of high costs in the construction field today and have discovered one vulnerable point to attack, that is, the factor of high insurance costs. Recognizing the reduction of insurance costs to be a question of reducing accidents it follows as a matter of course that the construction industry cannot afford to do otherwise than to institute a vigorous program for the prevention of accidents. The corner-stone of such a program must necessarily be accurately determined and properly tabulated accident statistics. Maximum results on a large scale cannot be achieved by individual companies playing a lone hand, but can only be obtained by the co-operation of all. Thus, there exists the necessity for every progressive organization to compile standard uniform accident records. That is, every company engaged on active construction operations should regularly compile its accident frequency rate, its accident severity rate, and in addition should tabulate all lost-time accidents as to cause in accordance with the standard methods outlined.

In a word, therefore, let us enter upon the road which leads toward the elimination of the present tremendous waste in money, man power, and production due to accidents in the construction industry. If we are to reap the largest dividends from our efforts and are to make the greatest headway toward the realization of the high humanitarian ideal of no accident we must be satisfied that as we proceed forward step by step our feet are firmly planted on the solid ground of facts; that is, our progress must be based on standard dependable accident statistics.

—The Associated Contractor

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Hot Water Question Solved By This Little Tank Heater

1. It is but 18 inches high and burns less than a bucket of pea coal or buckwheat coal a day.
2. Only 5 cents a day operating cost in the average household.
3. One-quarter the expense of gas devices to operate. (This is unprejudiced—we make and sell both kinds.)
4. It keeps a FORTY-GALLON tank constantly full of piping hot water. Plenty for bathroom, laundry and kitchen.
5. It needs but a moment's attention night and morning.
6. Quickly installed by any plumbing or heating contractor.
7. People who want to do away with their coal range and use a gas range, can heat their kitchen with a Novelty Tank Heater (larger size) installed in the cellar and in addition have all the hot water they can use.

In these days of many baths every household needs PLENTY of hot water—a FORTY GALLON tankful all the time, such as the Novelty Tank Heater supplies.

Install the Novelty in your houses. Get all the facts—now! Write or phone today for further information. Address Dept. BG-11.

TRUSCON

For Dampproofing and
Decorating Masonry Walls

THE TRUSCON LABO

Cracking, spalling and general disintegration of c
caused by absorption of water. Masonry can be
dampproofing the surface.

STONETEX is the masonry coating. Not only d
from being absorbed into concrete, stucco or brick
surface with a beautiful finish which lasts for years.
does not produce the "shiny" appearance of paint
masonry.

Plans in progress.

Hygeia Swimming Pool (alts. and add.), Atlantic City, N. J. Architect, S. Hudson Vaughn, Guarantee Trust Building, Atlantic City. Owner, W. M. Harris, care of architect. Brick, fireproof, 2 story add., 80x150 feet, plumbing, tile and marble. Plans in progress.

Residence, Brigantine Beach, N. J. Architect, D. A. Rosenstein, Humphrey Building, Atlantic City. Owner, H. G. Harris, Guarantee Trust Building, Atlantic City. Brick, hollow tile and stucco, 2 stories, 58x69 feet, tile roof, hardwood floors, cut stone, tile and marble, electric light, hot water heat. Plans in progress.

Residence, Passaic, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owner, P. J. White, Passaic, N. J. Brick, stucco, 2½ stories, slate roof, hardwood floors. Preliminary plans in progress.

Stores and Apartments, Warren and Perry streets, Trenton, N. J. Architects, P. L. Fowler Company, 224 E. Hanover St., Trenton. Owner, N. A. K. Bugbee, 206 Hanover street, Trenton, N. J. Brick, 3 stories, 46x60 feet. Plans in progress.

Bank Building (add.), 2616 Federal street, Camden, N. J. Architect, J. C. Jefferis, Temple Building, Camden, N. J. Owners, East End Trust Co., on premises. Brick addition. Plans in progress.

Church and Sunday School, Wildwood, N. J. Architects, H. Rex Stackhouse and W. W. Donohue, 1120 Locust street, Philadelphia. Owners, Lutheran Church, Wildwood, N. J. Details undecided. Preliminary plans in progress.

Restaurant, Shops and Offices, Federal and Broadway, Camden, N. J. Architect, Ralph B. Bencker, 1418 Walnut street, Philadelphia. Owners, Mastbaum Brothers & Fleisher, 1424 South Penn Square, Philadelphia. Granite, stone and brick, 2 stories, 40x120 feet, 40x100 feet, slag roof, electric light, tile, marble and terrazzo work. Plans in progress.

Residence, Haddonfield, N. J. Architect, C. R. Peddle, 136 South Fourth street, Philadelphia. Owner, Ernest Potts, care of architect. Brick, 2½ stories. Plans in progress.

Children's Building, Camden, N. J. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owners, West Jersey Homeopathic Hospital, Camden, N. J. Brick, cut stone, reinforced concrete steel, 4 stories and basement, 54x38 feet, wing 60x37 feet, slag roof, composition, linoleum and cement floors (steam heat, electric light, plumbing separate), metal lath, tile and marble work, elevators, painting and glazing, metal ceilings, shoring, integral waterproofing, iron stairs, ornamental iron work, kalamein doors, bond, elevator doors, limestone, electric dumb waiters, bluestone, steel toilet partitions, incinerator. Architects taking bids due November 23rd.

Store and Apartment (alts. and add.), 1307-09-11 Pacific avenue, Atlantic City, N. J. Architect, A. L. Brooks, Humphry Building, Atlantic City, N. J. Owner, L. N. Agrons, care of architect. Brick, steel, 4 stories, 50x100 feet, slag roof, hardwood floors hollow tile, electric light, metal lath, tile and marble. Architect will be ready for bids in one week.

Residences (20), Merchantville, N. J. Architect, private plans. Owners, Suburban Home Realty Co., 325 Market street, Camden. Brick, stucco, 2 stories, 16x40 feet, shingle roof, hardwood floors, hot water heat, electric light, tile work. Plans completed. Owners ready for sub-bids.

Bank, Moorestown, N. J. Architects, Davis, Dunlap & Barney, 1805 Walnut street, Philadelphia. Owners, Moorestown Trust Co., H. B. Coles, Moorestown, N. J. Brick, cut stone, steel, 1 story, basement and mezzanine, 85x42 feet, slag roof, cement, linoleum and oak floors, plumbing, roof ventilators, vapor heat, electric light, metal lath, tile, marble and terrazzo work, bond, ornamental iron work, metal lath, metal lockers, area grat-

On the Ground When Wanted

AN ambition to give your orders the kind of attention that will THOROUGHLY satisfy you—has established us as a dependable source of supply for terra cotta.

Architects taking bids due November 29th.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., October 30, 1925. Sealed Proposals will be opened in this office at 3 P. M., November 30, 1925, for the mechanical equipment of buildings, and outside services, at the Federal Industrial Institution for Women, for the Department of Justice at Alderson, W. Va. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Proposals will be considered only from individuals, firms or corporations possessing satisfactory financial and technical ability, equipment and organization to insure speedy completion of the contract, and who have established a record for expedition on contracts of similar character and magnitude. The fact that any concern obtains a set of the plans and specifications from any

source whatever and submits a bid shall not constitute a waiver of the forgoing stipulations. James A. Wetmore, Acting Supervising Architect.

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the installation of the electrical work and heating and ventilating of the Senior High School Building to be erected on the plot of ground lying at the northwest corner of West College Avenue and South Beaver street, York, Pa. The proposals must be submitted separately for the Electrical Work, and Heating and Ventilating—all in accordance with plans, drawings and specifications prepared by John B. Hamme, Registered Architect, York, Pa. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders.

Plans and specifications may be secured from David N. Crider, Secretary of the Board of Directors, in the Central School Building, corner of West King Street and Cherry Alley, York, Pa. A deposit or certified check for \$50 must accompany applications for each

set of the Electrical Work, or Heating and Ventilating plans and specifications, \$35 of which will be returned for each set when plans and specifications are returned accompanied with a bid.

In case no bid is received the entire amount of the deposit or check will be forfeited.

On or about Nov. 9, 1925, plans and specifications will be delivered to persons making application in accordance with the above requirements. Plans and specifications will be on view in the office of John B. Hamme, Registered Architect, Citizens' Savings and Trust Building; in the office of M. O. Lewis, Superintendent of Buildings and Grounds, in the Central School Building, York, Pa., and at the Builders' Exchanges in Philadelphia, Pa., and Baltimore, Md.

All bids must be signed, sealed, properly marked with name of contract bid upon and delivered to David N. Crider, Secretary, Central School Building, York, Pa., not later than 1 o'clock P. M., of Friday, November 20, 1925. All proposals received after the time advertised for receiving bids will be returned unopened.

The right is reserved to reject any and all bids.

EDWARD W. NEUMAN,

Chairman of the Committee on Buildings, Grounds and Fuel, of the Board of School Directors of the School District of the City of York, Pa.

The seasonal decline in construction operations has made its appearance, according to conclusions drawn from statistics compiled by the Associated General Contractors of America. The decline is robbed of some of its significance this

year, however, because the volume of construction still holds an abnormally high position close to the record-breaking heights it reached during the summer.

Though the volume of construction performed during October was five per cent

smaller than the amount shown for September, it was great enough to set a new record for the month.

The total volume of construction performed during the first ten months of 1925 exceeds by eight per cent the figure

for the corresponding period in 1924.

The average of construction costs in the principal building centres declined one point during October, reaching the lowest position occupied since the spring of 1923 and registering a drop of five points since July. The scale based on 1913 costs, shows the index figure for October to be 209.

The average of wages declined two points during October, reaching the index number, based on 1913, of 224. Although the month saw numerous small fluctuations in prices paid by contractors for the basic construction materials, the average of prices remained unchanged in October.

September was the seventh consecutive month in which contracts awarded exceeded by a considerable margin all previous records for a corresponding month. The total volume of contracts awarded during the first nine months of 1925 was thirty per cent greater than the volume awarded during the first nine months of 1924. The volume of building permits issued during September was seven per cent smaller than the August volume.

The total of concrete surface pavement awards, including streets, alleys and roads, for the first nine months of 1925 was eighteen per cent greater than the corresponding volume in 1924.

GREAT HILLIARD BRIDGE IS ENDURING MONUMENT TO RAIL STEEL BARS

By EDWIN F. PAYNE

Regarded as one of the outstanding engineering achievements of 1925 and a monument to rail steel reinforcing bars is the great Hilliard Road Bridge at Cleveland which will be opened to traffic in the near future.

This 1,000 foot structure spanning the gorge of the Rocky River links up in a much better way the main section of the city with its western district.

Beside its traffic advantages, the bridge marks another step in the amazing development of reinforced concrete construction in the United States in recent years. Probably no other form of construction has so proved its limitless possibilities as this. Apparently there are no boundaries to its field of usefulness.

The Hilliard Road bridge stands 140 feet over the river valley and its 25,000 cubic yards of concrete are reinforced with 730 tons of rail steel reinforcing bars—a material recognized by the engineering and architectural professions as of the highest standard.

This tough high elastic limit steel was selected for the structure by the engineering department of Cuyahoga County and was incorporated in the structure by the Walsh Construction Company. The de-

cision to use it was based on the results of many laboratory tests and on the record of its entire dependability as shown in countless building operations throughout the country.

The concrete was given frequent tests and showed ability to carry an enormous load while the rail steel bars conform to the specifications of the American Society for Testing Materials which provide a minimum tensile strength of 80,000 pounds per square inch.

The Walsh Construction Company injected several interesting engineering features into the building of this striking structure. With a height of 140 feet, the center span is 220 feet and the two main flanking spans are 189 feet each. The approaching arches are thirty foot span and the bridge is eighty feet wide over all.

On the construction, cableway installation was used, the mixers being fed by gravity from bins placed at the level of the roadway bridge.

Especial ingenuity was exercised in the type of centering used for the large spans. These consisted of four ribs each and it was at first contemplated to provide centering for one rib only throughout.

However, as specifications provided for centering being left in place for thirty days after the concrete was poured, this meant that approximately four months would be consumed in pouring the four arch ribs on the three large spans.

The construction company had at hand a number of steel centers designed for 140 foot spans. These centers were utilized, being supported on wood towers with frame bents on top of the centers to meet the requirements of the intrados as designed. The centering thus was placed for two ribs throughout at no greater cost than would have been the case had new centering been provided for one rib throughout only.

The result of this plan was that the four ribs on the main span were poured in a little over sixty days instead of four months.

It is estimated that enough concrete was used to build a six inch base for ten miles of streets.

It is apparent that rail steel reinforcing bars would not be specified for such projects as the Hilliard Road bridge, for the new huge grain elevators in Buffalo, for the waterworks projects now under way in Cincinnati, Washington, D. C., and St. Louis unless their dependability had been well established by scientific tests and by usage extending over more than a quarter of a century.

These bars are manufactured under the most modern practice. Taken from steel rails which in themselves have been subjected to every safeguard in making, they are again, in every step through the rail steel mills, under the keen eyes of experts.

There is no part of the manufacture of reinforcing bars from rails that is not supervised by men trained in the latest ideas of steel making.

When purchased from the railroads the material is subjected to the closest scrutiny. This inspection is continued as the rails are taken from the stacks in the mill yards to be cut into suitable lengths for heating. Imperfections which may have escaped the eye during buying, are quickly detected and the rail goes into a pile which will be sold to the junk dealer for smelting purposes.

Heating is watched with the utmost care, as no process of bar making requires keener attention. Through the slitter which slices the rail into three parts, head, web and flange, through the rolls, along the hot beds and until the bars finally lie in piles in the warehouse, some skilled worker is always on guard to insure perfect heating and handling, assuring the consumer as near 100% perfect reinforcing bars as is possible today.

As further guarantee of the perfection of its reinforcing bars, the Rail Steel Bar association has gone a step in advance of any similar group. It has adopted the system of free interchange of information regarding metallurgical and mechanical developments among its members.

In all of the mills of the association are employed metallurgical and mechanical experts who constantly are studying ways of improving rail steel products. In one mill an expert may work out an idea in furnace design that gives a more uniform or ideal temperature with a heat control more positive than in usual practice. In another mill the mechanical genius will develop rolling or hot bed methods of advantage to the finished product as well as to the industry. All these improvements and discoveries are relayed to the mills of this association.

The result, of course, is a uniformity of product impossible in associated groups where such interchange of information is not the practice.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

"ANTI-HYDRO" Keeps this Huge Warehouse Dry

UNIT C, ARMY SUPPLY DEPOT, CHICAGO, ILL.
S. Scott Joy, Architect. E. W. Spruiell Company, Contractors.

The concrete foundations of this enormous Army Supply Depot are waterproofed with "ANTI-HYDRO." The interior of the building is always dry.

"ANTI-HYDRO" was chosen for this job because "ANTI-HYDRO" results are known to be *permanent*. Twenty years of continuous use have proved that "ANTI-HYDRO" is the one dependable concrete hardener and waterproofer.

Being a liquid integral agent, "ANTI-HYDRO" mixes easily with the gauging water—any unskilled laborer can do it. It permeates the entire mass, producing uniformly hard and waterproof concrete *through and through*, instead of a thin surface coating. Use "ANTI-HYDRO" on your next job and see how economically you can produce permanent concrete.

As The Editor Sees It

THE EXODUS OF THE AMERICAN HOME

To the Country or to the Villages That Rim All Large Cities

BY JAMES A. KING

Another luxury of the rich is fast becoming a necessity to the man with a modest income—more of us city slaves are living in country homes. Vastly more of us will do so within the next ten years. If you want to be strictly in the swim of fashion by the time your home is paid for, build it in the country—or at least in one of those many tiny villages that rim all the large cities. By doing this now you will have the social advantage of being one of the old settlers by the time the movement has become general.

During the first four-fifths of the nineteenth century American population went through a decentralizing movement. Our forefathers broke through the barrier of the Appalachian mountains and scattered out over the vast continent lying to the west of that natural dyke. The economical, mental and spiritual readjustment following the Civil war stimulated this movement greatly.

The common urge was to own economically independent homes. This movement kept on until the Mississippi valley, the Great Plains, and the Pacific Coast valleys were dotted thick with them. In this process, a surplus of basic economic goods and raw materials was produced,

and mid-continent social development got out of balance.

Crowded Into Cities

To equalize this situation towns sprang up hither, yon, and everywhere. Little shops in these towns and villages expanded into great industries. Towns grew into cities. Children who developed into maturity under the isolated conditions of pioneer farm life longed for closer contact and more intimate association with their fellows. So they moved into town and city until population became more and more concentrated and centralized. Manufactured wealth multiplied many fold. Life became intricately subdivided and specialized. Occupation for wage became unstable and uncertain. Finally our social and economic development got somewhat out of balance on the other side.

Man is a social animal. He is also a rural animal. For countless millions of years he lived close to nature. So long, in fact, that he still has a strong and instinctive desire for open spaces and clean air. No sooner did those boys and girls from the lonesome pioneer farms get their hooks firmly into some good job in the city, and satiate their accumulated hunger for companionship of the herd, than they wanted to live at least in sight of—if not actually out in—the country.

The canal boat and the railroad had broken down the wall of the Appalachian range which held back their forefathers.

These brought their grandparents and their parents out into the west in that great decentralizing movement of a century ago. Now the telephone, the rural mail delivery, the cheap automobile, good roads, consolidated schools with free transportation for the pupils, bus and interurban lines, and the radio with Thor-like blows have broken down and annihilated the physical, mental and spiritual barriers that made country life of a generation ago so discouragingly isolated.

Now Moving to the Country

In rapidly increasing numbers the younger married people with small children growing up are moving out of the cities. Not to work in the country—but to live in it. To live out where the air is clean, where there is less noise, where their children can play in the open without going out into the streets, where they can raise a radish and keep a hen, where there are no "Keep Off the Grass" signs, where there is less of that demoralizing influence of the gang and the herd. Out where their home can be self-supporting for a considerable period of time when the exigencies of unemployment make this necessary.

Within a single century the American race has traveled one complete round of that gigantic circular stairway by which it is climbing to newer levels of a richer life. Our population decentralized, then it centralized again. Instead of simply getting back to where it was a century

F. R. ROSEN
5327 Market Street, Philadelphia

ago, the American race has gone far upwards toward its goal of a better civilization. It has conquered a continent. It has unlocked and appropriated to its own use the vast storehouses of treasure contained therein. It has given to each American a much larger volume of economic goods than is had by the average citizen of any other nation on earth.

Now our population is starting out on another great decentralizing movement. One that is pregnant with possibilities of still greater achievement. It will break down the artificial barriers that have too long separated the town dweller from his own skin-brother who lives in the country. It will fill up many of the voids in our social structure. It will weld the entire mass of our population into a more stable and a more homogeneous whole.

Good roads and automobiles so cheap that almost any family can own one are not going to kill the little towns and villages situated near the cities. They will bring people from the cities out to live in or near these villages.

That is the trend of our population today. Most people who can would rather live out in the quietness and the purer air of the open country or the small village and drive into the city for an occasional mild debauch than to live in the dirt, the grime and the noise of the city and drive out into the country on Sunday for a breath of fresh air. This is not idle theorizing. It is recognizing the early stages of a movement that has already made an appreciable beginning.

Bankers and real estate men of the small villages forming a fringe about every large city tell me they already recognize this tendency. City people of modest means are coming out into these villages, buying lots within the village—or acreage adjoining it—and building homes on them.

There are sound reasons for this decentralizing movement. The price of a good lot on a paved street near a business center in the city will buy two or three

larger lots or even a quarter block on the pavement—or just off it—in the village. It will buy one or more acres on a paved highway just outside. The same house with the same conveniences and comforts can be built for the same price,—or even for less money.

Time, not distance, determines how far one lives from his work. The family that can finance a flivver can move out a mile for every two or three blocks father now walks to work, and get there in practically the same time now consumed.

Business itself is decentralizing rapidly, and this will help materially to decentralize population. High rent of the congested down town districts of the cities where land values are sky high is stimulating the construction of office buildings miles out on carlines and boulevards where land values are only a fraction of what they are in the down town section. Factories are moving out of the metropolitan cities into the suburbs and even into the smaller cities that have good transportation facilities.

This decentralization has already gained noticeable momentum. In a very few years it will have grown into a flood-tide epoch, making movement of our population.

Right now is an excellent time to build your country home. Land prices are still low; as the movement gets stronger they will go higher. If you are living in a large city, choice locations are still available really quite close in. If you are living in the smaller cities and towns farmers will welcome you, will sell you an acreage near their own building site at a very modest price in order to have the companionship of a nearer neighbor. That neighboring will make better citizens of both of you.—*The Small Home.*

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

INNOVATION IN CONCRETE WORK

The tower of the Church of the Ascension of Our Lord, situated at F and Westmoreland streets, Philadelphia, was constructed recently of reinforced concrete.

The tower is 180 feet high and the floors are of the flat slab construction type. The main feature of this tower is the type of dome, which is elliptical, while the usual type of dome is spherical. The arch is supported on a wall five inches thick, four feet six inches high, which is unusual, as most domes spring directly from the roof slab.

The major axis is nineteen feet, nine and one-half inches and the minor axis thirteen feet seven inches;

thickness of slab at top is three and one-half inches. An arch action occurs at the top which has a tendency to push the dome in approximately one-half the distance below the point of counter-flection, the action changes and the tendency is for the dome to be pushed outward.

The plans for this Church were made by the Hoffman-Henon Company, architects, of Philadelphia; the general contractor is John McShain, of Philadelphia. The details for the reinforced concrete were made by Frederick Massiah, Philadelphia. Mr. Massiah erected the reinforced concrete floors and the dome.

Mr. Massiah is a Civil Engineer, known throughout the country in the building industry. He is a native of the West Indies and is one of the largest construction engineers of his race.

Attention to details in his work has earned for Mr. Massiah an enviable reputation. He has erected the reinforced concrete work in many large office buildings, churches, schools, factories.

THE BATHROOM, A MOST IMPORTANT ROOM

By R. A. JENKENS

A well planned and well equipped bath room makes a home more comfortable to live in than it would be without it, easier to sell and, most important of all, it safeguards the health of the family to a great extent. There really is no better investment for the home than the best possible bath room appointments and plumbing.

One bath room is no longer considered sufficient for any save the very small family, say one that consists of not more than four persons. Even in a home of this size if the house is a two story one, an extra toilet is a convenience. The bath room facilities can also be greatly increased by installing separate lavatories in the bedrooms. Often a closet for a lavatory can be arranged for under the stairway, opening into the central hall.

The question of the size of the bath room is always an important one. If the room is too large it means wasted space, heat and energy in cleaning it. If the room is too small it is uncomfortable and unsatisfactory. Just enough space should be planned for so that there is room enough to move around each fixture comfortably.

Tile, glazed for the dado and unglazed for the floor, laid in cement is a perfect material for the purpose as water cannot penetrate it and there are no cracks for dirt to collect in. Rubber flooring, the sort that looks like linoleum, is also excellent. The walls above the dado and the ceiling should be of hard plaster finished smooth. When a shower bath is

installed over the tub the tile is run up to the ceiling on the two walls.

Bath room fixtures have become so standardized that all of the leading companies make patterns that are very much alike in appearance. A few of the firms specialize in distinctive patterns of their own, of course.

Enameled iron and porcelain are the two materials most commonly used for all kinds of bath room fixtures. A porcelain enameled fixture is one that is made of cast iron enameled on both sides. This material is durable, attractive in appearance, light in weight and generally priced moderately. Porcelain is a hard, impervious material that serves its purpose in an excellent way. Vitreous china is also much used for water closets and lavatories.

There are three general types of bathtubs, those with legs that leave a space under and back, tubs with a closed base underneath, and built-in tubs that entirely fill a niche at one end of the bathroom. It is very apparent that the tub that leaves space under and around it to be kept clean is the least desirable. It is the least expensive, though, so is often used. While the other types do cost more they cut down on the amount of floor tile that has to be laid.

For use in the ordinary home, a tub five feet long, thirty inches wide, with the rim about two feet from the floor is usually the one recommended. The legless tubs are generally several inches lower than the others, thus making them easier to emerge from. Just as with the toilet, the better the tub, the less noise the water makes in entering it.

The popularity of the shower bath has created a demand for shower bath equipment that has been generously supplied. Most of the arrangements for shower baths, even the ones moderately priced, are revelations of comfort and convenience.

The styles of lavatories are many, although they all now have the common characteristic of being easy to clean. The sizes are so well standardized that it is rarely necessary to give dimensions. Lavatories may be had for corners, or straight walls. They may have a center pedestal, fluted or not, legs of varying number or be hung on the wall by brackets.

Various materials are used such as porcelain and nickel and porcelain-like enamel for faucets. For most fixtures the porcelain and nickel faucets are the best and require the least care.

It is always best to have one faucet through which both hot and cold water can flow. The faucet should have enough of an overhang if it is in the lavatory so that it is possible to get a glass under it for filling. This has been taken care of in designing most faucets.

A minimum of noise is the least that can be expected in a water closet. If one is fortunate to possess one that operates quietly enough so that the noise of the water is not heard outside of the room, they can be well satisfied. More errors are made in the selection of this fixture than any other, the plumbers tell us. The reason for this is that it is really the most complicated of the fixtures and the average person just assumes that it will work all right and lets it go at that. It is only after the closet has been installed some time, proven repeatedly unsatisfactory and been replaced that the subject becomes an interesting one.

The best water closets like the best lavatories and tubs now have a valve on the supply pipe so that the closet can be shut off if necessary without shutting the water off to the other fixtures. One closet omits the fan at the rear of the bowl which offers an offensive fouling surface unless the flow of water is strong enough to prevent.

The incidental fittings such as chairs and stools are usually in white enamel or made to match the general color scheme.

The question of closets and cabinets in the bath room is one that is generally settled individually. There are the wall and mirror type and the long door closets that offer a full length mirror. The medicine cabinets come in steel or wood with glass, steel or wooden adjustable shelves. Some have mirrors in the door with a shelf beneath and some do not. A glass shelved towel closet is a real convenience.

Compartments for the soap, sponge and glasses are now often recessed into the walls. This puts the glasses where they are not apt to be broken. There are dozens of ways to take care of the tooth brushes in a hygienic way so this need not be touched upon.

When you list the things needed in the bath room you find they are few, yet they are so important that it is wise to plan the bath room early in your building program, working with your architect and always remembering that every bit of poor plumbing that goes into your home will soon show up and have to be replaced. Besides the cost of the first fixture plus installing and removing will be a loss.—*Keith's Magazine*.

SELECTING THE HARDWARE FOR A SMALL HOUSE

In the hardware to be used in the small house the material throughout may be yellow brass, or, if one wishes to keep strictly to Colonial ideas, of wrought iron for the more important fittings.

The desire, however, for economy leads to the recommendation that yellow brass be used. Later on it may be replaced by wrought iron when the home-owner wishes to add a few touches.

The front door should have an outside escutcheon of a Colonial pattern, about 9 inches long. The inside escutcheon should have a length of 7 inches. The knobs should be of brass. Here it is necessary to sound the warning that brass, and not iron finished as brass, is recommended. This warning is for all the hardware.

The terms "butts" and "hinges" are used interchangeably. They are made of cast iron, wrought iron, wrought steel, cast bronze and brass. There are many made simply by pressing and the use of butts termed "light" must be avoided.

Use for a small house brass butts lacquered after polishing, with strong steel pins, having brass heads. The butts for the front door should be about 5 inches or 6 inches long and the full width of the thickness of the door, with strong edges.

For the doors of the living room and dining room use butts about one inch shorter than the butts for the outside door. For all other doors throughout the house use 3-inch butts. Never use anything shorter.

The size and weight of the butt depend obviously on the size and weight of the door. All doors under 7 feet in height may be hung satisfactorily with one pair of butts. If it is higher than this and very heavy, three butts should be used, one in the middle, one near the top and one near the bottom.

The front door and back door require only two bolts, one actuated by the handle and the other by a key. Use the best quality lock, mortised.

The inside doors communicating between rooms need be single bolt locks only, actuated by the handle. No keys are required. In fact, keys for inside doors usually are lost within a year after a house is occupied.

On the inside of the bedrooms a bolt may be fastened. This is to satisfy timid persons who would like to lock themselves in for the night. They also serve for reassuring guests who may spend a night in the home and who will feel more secure with a bolted door.

The door to the bathroom should be fitted with a lock having two bolts, one actuated by the door handle, the other a shot bolt, not requiring a key. There is an advantage in the use of such hardware which is not often thought of. It is that there is no danger of a door accidentally being locked when the wind blows. This, of course, can happen with but one type of lock, but it happens often enough, for this self-closing type is often used.

The contractor should furnish the sash weights of such size, shape and weight that the windows will work satisfactorily. This is important. Use only the best make of sash cord, always of course an advertised brand. There is economy in this. The difference is merely the cost of the cord. If a cheap cord is purchased, the cost of replacement is high, being

about ninety-five per cent labor. Then there is the improved spring balance sash hanger, several types of which are deservedly very popular, as they do away entirely with the troublesome weights. Another device holds the sash firmly by means of friction wheels held by a powerful spring, with enough give, however, so sash can be easily moved up or down.

Have proper sash fasteners on the sash to lock them shut and prevent rattling. Sash lifts on the lower sash should not be omitted. Many do not like their appearance, but they are convenient when the sash sticks. They enable one to raise and lower a sash without doing anything to distort the frame.

The door knobs throughout should be of glass, especially on the second floor. Some may prefer that all the knobs on the first floor be alike, following the style of the front entrance door.

The hardware in the basement may be of iron, but it should be of good quality. There is no economy in trying too closely to save on hardware. The knobs should preferably be black, as this is better looking than white.

The sash casements being of steel will come supplied with fasteners.

There should be bolts on all closet doors and on the kitchen cabinets. When the door is easily gotten at and is not over three feet high, one bolt will be sufficient. It should be of the ordinary horizontal type and of the type classed as "medium-weight."

Doors more than three feet high and doors not easily gotten at should have two bolts working vertically, one at the top and one at the bottom. These should be

mortised in and be operated by a lever on a long vertical rod that will operate the two bolts with one turning of the handle. The handle should be located at a height where it may easily be used. This handle should not be so small that it is presumed it may be turned with the fingers. Such a handle is useless when the bolt sticks. The handle should be generous in size, to be grasped by the hand. A lever handle is best and most ornamental.

Keep close after the painters, to see that they do not splash the hardware. By far the better way is to put all interior hardware in place after the painters are through, the escutcheon plates on the outer door being removed for the convenience of the painter and replaced when the painting is finished and dry. It will certainly pay to look after this little detail.

Do not accept the job until all rattling of doors is eliminated.—*Building Age and National Builder*.

BETTER BUILDING CONSTRUCTION ONE OF THE MOST EFFECTIVE WAYS TO FIGHT FIRE

One of the most important ways in which our tremendous annual fire loss (which now exceeds 500 million dollars) can be reduced is through better building construction, says Mr. S. H. Ingberg, Chief of the Fire Resistance Section of the Bureau of Standards, Department of Commerce. While this method of reducing fire losses necessarily takes some time in yielding apparent results, it is nevertheless, one of the most effective ways of combating this destructive element in the long run.

It is to be hoped that as old buildings are replaced, and as the new construction reflects to an increasing extent the knowledge gained in the laboratory and through studies of actual fires, the destruction of property will decrease.

The Bureau of Standards is carrying out many investigations with the object of improving the fire resistance of building materials and construction. Tests are being made on full-sized columns, walls, and partitions, using specially designed furnaces in which the temperatures encountered in a burning building can be duplicated. In this way the behavior of different kinds of construction and the value of all the commonly used building materials can be studied under accurately controlled conditions.

In order to find exactly what temperatures are reached in a burning building and to find how long a given temperature is maintained, the Bureau has constructed a special fire test house in which actual fires are "staged", from time to time. This small building is fitted up with discarded furniture and supplies to simulate any desired occupancy and is then set on fire and the necessary data secured. From the

results of this work it has been possible to state just what temperatures ought to be in the experimental furnaces.

Other tests have covered roofing materials, theater curtains, and office furnishings such as filing cabinets and safes. In the case of safes the fire test is followed by a drop test to simulate the rough treatment which a safe receives when the floor of the building collapses. If the safe withstands the drop test it is heated again in the furnace, as would be the case if it had fallen into the basement and was surrounded by burning material.

While these tests may seem destructive on first consideration, they are in reality one of the most constructive lines of work now in progress in the Bureau.

ORDINARY CARE

Ordinary wear and tear is a common expression on a construction job. It usually is taken to mean the effect on equipment of every day use. Ordinary care is an unusual expression. It would probably be interpreted to mean less than good care.

Few men handling machinery realize, however, that even the simplest piece of equipment should have more or less constant attention. General overhauling at times is customary on even the worst managed jobs. But there are few superintendents who insist that equipment be given the regular oiling and adjustment that it needs. Even those who do require such attention, have difficulty in finding men who have any mechanical sense.

With everything possible done by machinery these days, the situation requires that the superintendent who gets results must make sure that his machine runners look after their equipment properly. Most runners have to be shown how and when to lubricate and to adjust machines that are new to them. Once shown, it is the superintendent's job to check up regularly to see that instructions are being followed.

One organization weakness that crops out even in the best of large concerns is that a new man is not properly instructed about his machine. A piece of equipment may be giving fine service with an experienced runner. When he leaves, the new man too often is shown only the main features of the machine. He is rarely taught how to give his machine the ordinary care it needs all the time. The result is that his machine soon goes bad. Then he gets the blame, when it really should be laid to the man in charge of the job. It is up to him to be certain that his men know what they ought to do, and then to see that they do it.

As the amount of equipment used on construction work increases, and with the increase comes more complicated machinery, this idea of constant care—ordinary care—must be driven home.

Equipment builders are doing all they can to design machinery that requires a minimum of attention. But lubrication and adjustment will always be required. It is up to the superintendent to see to it that his equipment gets this ordinary care.—*Successful Methods*.

CARRYING COALS TO NEWCASTLE

America has looked to England for inspiration in the manufacture and use of brick. The great saving in fire loss recorded in England is conceded to be because of the predominance of brick construction and the consequent lowered liability to fire. Now comes a writer in England who quotes America as leading in brick construction.

The *New York Herald*, a leading newspaper of the United States, puts it aptly and strengthens the statement of the English writer, in a leading editorial. The *Herald* says:

"The boast of the Emperor that he had found Rome built of brick and would leave it built of marble must, according to a recent British observer, be practically reversed concerning New York in our day. We found it built of brownstone, and we shall leave it built principally of brick. The writer—in *The Manchester Guardian*—comments with an approval verging upon enthusiasm upon the appearance of the brick facades which now largely line some of the finest avenues. The English writer says:

'The combinations of marble or Indiana stone and brick are usually simple and effective. The American architects seem to have given themselves to the study of brick with characteristic closeness and intelligence, and everywhere one came on new signs of their mastery of the subject. . . The brick varies in color from an unsuccessful lemon white to deep red, with some particularly fine oatmeal tints in the later buildings that take the sunshine with a radiant sweetness. . . In the clear, gay atmosphere of Manhattan, these oatmeal palaces are delightful, even lovely at times, as they take the glow.'

"Perhaps not many New Yorkers have observed their own city with such eyes as those of this British visitor. Those who take pains will, however, perceive much truth in his remarks. The variety of coloring to which he refers has a great and generally pleasing range, and so has that of their surface texture while of course, the pattern and order of laying them must be susceptible of corresponding diversification. A block or a street, therefore, built of brick is easily capable of an artistic and harmonious variegation which would scarcely be possible with an exclusive brownstone or marble or granite construction."

—*American Clay Magazine*.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

"ANTI-HYDRO" Keeps this Huge Warehouse Dry

UNIT C. ARMY SUPPLY DEPOT, CHICAGO, ILL.
S. Scott, Inc., Architect. E. W. Sproul Company, Contractors.

The concrete foundations of this enormous Army Supply Depot are waterproofed with "ANTI-HYDRO." The interior of the building is always dry.

"ANTI-HYDRO" was chosen for this job because "ANTI-HYDRO" results are known to be *permanent*. Twenty years of continuous use have proved that "ANTI-HYDRO" is the one dependable concrete hardener and waterproofer.

Being a liquid integral agent, "ANTI-HYDRO" mixes easily with the gauging water—any unskilled laborer can do it. It permeates the entire mass, producing uniformly hard and waterproof concrete *through and through*, instead of a thin surface coating. Use "ANTI-HYDRO" on your next job and see how economically you can produce permanent concrete.

Every Morning You Get the "Leads" that Lead to Business

THE man who has a prospect list of concerns in the market for what he sells certainly has a distinct advantage over the man who must dig around for his leads.

You can have this advantage by subscribing to the

Daily Building News

a daily, authoritative compilation of advance construction news, contracts awarded and other vital information together with names, addresses of interested parties.

It's a service that repays you many times its cost.

Give us a ring today and we will explain fully and tell you how little this service costs.

Hot Water Question Solved By This Little Tank Heater

1. It is but 18 inches high and burns less than a bucket of pea coal or buckwheat coal a day.
2. Only 5 cents a day operating cost in the average household.
3. One-quarter the expense of gas devices to operate. (This is unprejudiced—we make and sell both kinds.)
4. It keeps a FORTY-GALLON tank constantly full of piping hot water. Plenty for bathroom, laundry and kitchen.
5. It needs but a moment's attention night and morning.
6. Quickly installed by any plumbing or heating contractor.
7. People who want to do away with their coal range and use a gas range, can heat their kitchen with a Novelty Tank Heater (larger size) installed in the cellar and in addition have all the hot water they can use.

In these days of many baths every household needs PLENTY of hot water—a FORTY GALLON tankful all the time, such as the Novelty Tank Heater supplies.

Install the Novelty in your houses. Get all the facts—now! Write or phone today for further information. Address Dept. BG-12.

ABRAM COX STOVE COMPANY

Factory and Show Room, American & Dauphin Sts., Phila. Established 1847

Better Highways in Better Time

HIGHWAY builders have learned that the use of Van Sciver Service means better highways in better time and with better profits.

Clean, sharp concrete sand and graded gravel, mined and prepared by modern methods and shipped when and where required—that is what made it possible for the highways pictured above and many others to be completed ahead of schedule.

Brick, steel, 3 stories, 76x74 feet, slag roof, oak and pine floors, vapor heat, electric light, metal lath, tile and marble, ornamental iron. Contract awarded to Samuel Dolinsky, 2 North Vermont avenue, Atlantic City, N. J.

Manufacturing Building, Gloucester, N. J. Architect, Clarence Wunder, 1520 Locust street, Philadelphia. Owners, Forest Mercery Co., Gloucester, N. J. Brick, steel, 2 stories and 1 story and basement, 100x43 feet, wing 24x33 feet, electric light, slag roof, pine floors, cement floors, ornamental iron work. Contract awarded E. E. Hollenbach, Inc., 1804 Brandywine street, Philadelphia.

Factory (add.), 1643-47 Haddon avenue, Camden, N. J. Architect, Clarence E. Wunder, 1520 Locust street, Philadelphia. Owners, Acme Staple Co., on premises. Brick, steel, 2 stories and basement, 145x87 feet (plumbing, heating and lighting reserved), slag roof, asphalt, pine and maple floors, painting and glazing, hollow metal sash, rolled steel skylights, fire doors, bond, ornamental iron work. Contract awarded Paul Brosz, 2511 West Huntingdon street, Philadelphia.

Residence and Garage, Woodbury, N. J. Architect, Charles R. Peddle, 120 South Fourth street, Philadelphia. Owner, Mrs. Helen K. Knight, care of architect. Frame, 2½ stories, 27x44 feet, 18x20 feet, shingle roof, cement and hardwood floors, warm air heat, electric light, tile work. Contract awarded Heaton & Potter, Woodbury, N. J.

School, Carney's Point, N. J., \$53,487. Architect, Charles R. Peddle, 149 South Fourth street, Philadelphia. Owners, School Board of Carney's Point, N. J. Brick, steel, 1 story, 60x120 feet, slag roof, maple floors. Contract awarded George W. Shaner & Son, Palmyra, N. J.

Residence, Haddonfield, N. J. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, F. C. Propert, Haddonfield, N. J. Hollow tile and stucco, 2½ stories, 26x42 feet, slate roof, hardwood floors, vapor heat, electric light, tile work. Contract awarded to J. H. Hahn, Collingswood, N. J.

Building (add.), 309 Broadway, Camden, N. J., \$15,000. Architect, F. Herbert Radey, 717 Haddon avenue, Camden, N. J. Owner, D. C. Hart, 309 Broadway, Camden, N. J. Brick, 2 stories add., 21 feet 6 inches x 48 feet, slag roof, electric light. Contract awarded to Percy V. Cope, Kennett Square, Pa.

Building, 1020 North Twenty-fourth street, Camden, N. J., \$6,000. Architect, private plans. Owner, Oscar Steckle, Camden, N. J. Block and stucco, 1½ stories, 27x43 feet, rubberoid roof, hot water heat, electric light. Contract awarded to Adam Stephan, 3275 Pelham Place, Camden.

Lumber Shed, Southeast Corner Front and Chestnut streets, Camden, N. J., \$3,000. Architect, private plans. Owners, C. B. Coles & Sons, Front and Kaighn avenue, Camden, N. J. Frame, 1 story, 56x65 feet, asphalt roof. Contract awarded to Richartz & Furner, 1838 Fillmore street, Camden, N. J.

Miscellaneous Construction News

Theatre (alts.), Baltimore, Md., \$100,000. Architect, William H. Lee, 1505 Race street, Philadelphia. Owners, Independent Theatres Corp., 1321 Vine street, Philadelphia. Details undecided. Plans in progress.

Junior and Senior High School, Hastings-on-the-Hudson, N. Y. Architects, Shreve & Lamb, 331 Madison avenue, New York City. Owners, Board of Education, Hastings-on-the-Hudson, N. Y. Brick, cut stone and steel. Owners taking bids due December 15th.

Miscellaneous

Contracts Awarded

Residence, Winston-Salem, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, Richard G. Stockton, Winston-Salem, N. C. Brick, 2½ stories, 87x42 feet (plumbing, heating, electric and tile work reserved), slate roof, hardwood floors. Contract awarded Fogle Brothers, Winston-Salem, N. C.

SEMI-ANNUAL STATEMENT BY AMERICAN CONSTRUCTION COUNCIL

*Headquarters 28 West 44th Street, New York—Through its President,
Franklin D. Roosevelt*

Although 1925 has been a record breaking year in volume of building construction for most sections of the country, the first ten months of the year already exceeding the total of 1924, there is still a definite scarcity of suitable housing for persons of average means. The large volume of residential construction has not yet met the country's real housing need. City residential construction has been largely of higher priced apartment hotels and apartments of a speculative nature, and while suburban home developments of the colony type have been very active, they have too frequently been high in price or very inferior in quality. Farm homes, where the owner's individual taste prevails, show a tendency toward modern home improvements and home utilities in an increasing degree.

The general situation as to housing, however, is such as to call attention forcibly again to the great need for proper

planning, sounder financing and better construction of homes, a condition which the Council has repeatedly pointed out and already done much to remedy through its nation-wide campaign for better building. Through this movement for better buildings, started by the Council several years ago, representatives of all the component parts of the construction industry, from investor, owner or tenant to builder and mechanic, are engaged in one of the most notable co-operative endeavors of a great industry ever witnessed in modern business to deal with its relations to the public. The Council is happy to state that these efforts are receiving the hearty co-operation of the leading branches of the construction industry, some of which, following its suggestion, have already taken up the problem for careful analysis and treatment from their respective angles. In the last analysis however the remedying of conditions demands that the public of the country, assisted by the intelligent leadership of the industry as a whole, must learn the essentials of right construction and then insist that they be put into practice.

The dominating type of building construction has varied for different sections of the country, depending upon local conditions, but aside from residential work public improvements and utilities and commercial buildings have played a relative large part for many districts. Institutional buildings have also been active.

Present indications point toward an increasing demand for industrial buildings and replacement or alteration of out-of-date buildings of commercial and other types. Building activity has been generally pronounced in outlying districts as well as in the large centers, a tendency which is continuing. Work contracted for and contemplated for winter schedule is much greater than usual this time of the year, showing the growing belief of the public in winter work when it is properly conducted.

Labor productivity has increased and thus helped to reduce actual costs, and the stabilizing influence of this condition, if maintained, will be very helpful for the future. Material prices have also continued relatively stable as a whole. Money for building purposes has been readily available in most localities.

These facts point toward continued stability in volume of operations for the industry as a whole, and the Council urges that all new work possible for the winter season should be undertaken and carried to completion so as to avoid a spring congestion. The public should be doubly cautious, however, as to the character of construction it accepts for its money. With the gradual overcoming of the postwar shortage and passing of temporary building booms in some localities the return to normal consideration

of building values will make structures of inferior quality an increasingly heavy liability. There are evidences in some few localities that the element of caution is already curtailing speculative operations.

The other great branch of construction—the building of highways, transportation systems and the like—also merits the earnest attention of the public. The construction of highways has in many sections been going forward rapidly, but the fast development of suburban districts and the natural growth of outlying areas have brought a serious traffic problem before the country. The better articulation of transportation in its various phases to the needs of each community is a growing necessity. Along with this should go better and broader city planning and zoning which will take into account the needs of the future for years to come. More and better highways to handle adequately the traffic between the fast growing communities in outlying districts as well as to and from the large centers are a large factor in the development of national economy and should receive every proper encouragement.

IMPORTANT CHANGES IN THE MANUFACTURE AND GRADING RULES OF VITRIFIED SANITARY-WARE

Important changes in the manufacture and grading rules of vitrified sanitary-ware became effective last month as the result of a Conference of manufacturers and distributors with government representatives at the Bureau of Standards. It was announced by the Bureau of Standards which has acted as a clearing house for the development of the program. The grading rules do away with Grades A. and B., substituting the classifications "regular selection" and "culls." They also provide for accurate definitions which will facilitate the grading, so that the quality can be determined readily.

The Conference brought together the representatives of 27 companies. The discussion of the grading rules brought to light a sentiment that any run of kiln which fell below "regular selection" should be sold as "off grade" or scrapped. It was pointed out that each piece of ware put through the kiln costs the same to manufacture; and that the proposal would prevent any unscrupulous distributor from selling a Grade B as a Grade A, and leaving an impression in the mind of the purchaser that he was getting a Grade A at a low price. It was further indicated that the proposed classification would be the same as that followed in grading porcelain ware. The change was adopted by each individual present.

The Conference voted to recommend that the United States Government specifications for plumbing fixtures be held

up pending the extension of the program and the following through of the regular procedure of the Division of Simplified Practice. This will not be done until the simplification committee of the industry has compiled results of a questionnaire which will deal with dimensional standards.

As a protection to the buyer, the meeting voted that each manufacturer will make each crate in which "cull" ware is to be shipped with two slashes of red. This will be applied to the small end of such crates, so that they will be visible readily and will indicate to the distributor, or to the user the grade he is getting.

As a further step toward elimination of waste in this industry, steps were taken to survey the variety of items and the demand of each produced by each manufacturer. This will serve as the basis for possible eliminations of obsolete varieties or of those seldom in demand; and will pave the way for a more compact list which will meet all needs.

Because the change of grading rules will involve a complete change of labels by all manufacturers, a sub-committee of manufacturers was appointed comprising H. S. Maddock, of Thomas Maddock's Sons Company, Trenton, N. J.; George E. Hoffman, of the Trenton Potteries Co., and W. C. Chamberlin of the Standard Sanitary Manufacturing Co., of Pittsburgh, Pa.

The conferrees took immediate steps to notify all distribution centers of the changes in grading, and in grading rules, and to cause the preparation of 100,000 copies of the new rules, which are to be put into the hands of the plumbing trade, architects, contractors and others who have an immediate and direct interest in the action taken.

The attendance included the following: W. J. J. Bowman, Superintendent, Trenton Fire Clay & Porcelain Co., Trenton, N. J.; E. V. Brigham, Vice-Pres., Kalamazoo Sanitary Manufacturing Co., Kalamazoo, Mich.; Arthur J. Burgnor, Superintendent, Resolute Pottery Co., Trenton, N. J.; Frederic R. Byford, Pres., Potomac Pottery Co., Inc., Keyser, W. Va.; W. C. Chamberlin, vice-pres., and general sales manager, Standard Sanitary Mfg. Co., Pittsburgh, Pa.; F. G. Clifford, president, Chicago Pottery Co., Chicago, Ill.; A. C. Cochran, manager, Kohler Co., Trenton, N. J.; H. N. Corning, Ironsides Pottery Co., Bordentown, N. J.; R. E. Crane, president, Elir Co., Ford City, Pa.; Thomas N. Deets, President, Economy Pottery Co., Trenton, N. J.; James A. Dorety, Jr., president, Acme Sanitary Pottery Co., Trenton, N. J.; Philip I. Faherty, vice-president, Lambertville Pottery Co., Lambertville, N. J.; C. T. Ford, Sales Department, Mueller Co., Decatur, Ill.;

James G. Gastler, Office Mgr., J. Amis-son & Sons Pottery Co., Bristol, Pa.; A. S. Healey, secy.-treas., Healey Pottery Co., Trenton, N. J.; George E. Hoffman, sales mgr., Trenton Potteries Co., Trenton, N. J.; Chris. Horton, president, Horton Pottery Co., Chillicothe, O.; F. A. Jones, Vice-Pres., and Gen. Mgr., Abingdon Sanitary Mfg. Co., Abingdon, Ill.; G. C. Kalbfleisch, Gen. Supt., of Potteries, Standard Sanitary Mfg. Co., Pittsburgh, Pa.; C. J. Kirk, president, Universal Sanitary Mfg. Co., Newcastle, Pa.; Harry J. Lyons, president, Keystone Pottery Co., Trenton, N. J.; A. M. Maddock, president, and H. S. Maddock, vice pres., Thomas Maddock's Sons Co., Trenton, N. J.; James E. Norris, Ironsides Pottery Co., Bordentown, N. J.; Arthur Plantier, president, Sanitary Earthenware Specialty Co., Tiffin, O.; Arthur J. Podmore, Treas., Camden Pottery Co., Camden, N. J.; George E. Rhodes, Pres., Kokomo Sanitary Pottery Co., Kokomo, Ind.; B. O. Tilden, Pres., B. O. T. Manufacturing Co., Trenton, N. J.; Oscar B. Van Fleet, Pres., Van Pottery Co., Trenton, N. J.; J. E. Wright, Pres., Wheeling Sanitary Mfg. Co., Wheeling, W. Va.; Carl H. Zwermann, W. A. Case & Son Mfg. Co., Robertson, Ill.; P. H. Bates, chief, Ceramics Division; Dr. L. J. Briggs, chief, Division of Mechanics and Sound; I. J. Fairchild, and A. C. Harrison, Bureau of Standards; H. R. Colwell, simplification specialist, Division of Simplified Practice. Frederick W. Donahoe, of Pittsburgh, secretary of the simplification committee.

The further surveys to be made of the industry will be under the direction of Mr. Donahoe.

Methods of making satisfactory plastic magnesia, used extensively in the manufacture of stucco and composition flooring, from the magnesite deposits of the Western States have been developed as the result of an investigation conducted by the Bureau of Mines, Department of Commerce. The investigation also revealed that plastic magnesia of fair quality could be produced from dolomite, a material cheaply obtainable in the Eastern States, where the market for plastic magnesia is largest. The experimental work of the Bureau of Mines was conducted with magnesite from Washington and California, with the view of aiding American producers in establishing a domestic industry to compete with material heretofore largely imported.

The first commercial use of magnesian cements was in Germany, the Bureau of mines points out in a report just issued. Their use in the United States was just being established at the beginning of the World War, but is gaining rapidly at present. Most of the plastic magnesia

now made from domestic magnesite comes from California producers.

Magnesia stucco has gained headway in competition with cement stucco largely because it makes a stronger, harder, and more elastic cement which adheres more firmly to wood surfaces and takes and holds dashes of ornamental colored pebbles as well as other stuccos. This stucco gives a house a more finished appearance, probably due to the colored pebbles, but it has one disadvantage—it is not as weatherproof as cement stucco. Weatherproofing compounds are therefore being tried. The structural firmness and density of the stucco are the qualities that best insure protection, and these qualities largely depend on the quality of the plastic magnesia used, which in turn depends mainly on selecting suitable raw material and accurately controlling the proper calcining temperature. Judged from the cumulative experience of the industry, properly made magnesian stucco is resistant enough to weathering to be considered entirely satisfactory.

Composition floors, if properly laid, are quite satisfactory. They are permanent, warm to the touch, elastic, fireproof and fairly ornamental, and can be laid over old or new wooden floors. Bathroom floors and walls are now quite often covered with the composition and bathtubs are frequently encased in it. Slabs of the same material, often appropriately tinted, are used for drainboards in kitchen sinks and for similar purposes.

Interior plaster made with plastic magnesia offers a field as yet little exploited. Other uses for the material will doubtless develop. At present manufacturers of composition flooring and of stucco buy plastic magnesia and prepare mixtures that are ready to be moistened with magnesium chloride solution at the point of application. Formerly the supply of plastic magnesia was variable and occasionally bad, but this condition is now rapidly improving.

Recarbonation of free lime in burned dolomite or plastic magnesia, in order that these materials will yield satisfactory magnesian cements, has proved of great value for dolomites, but of doubtful value for magnesites, although they are benefited to some extent.

The big centers of consumption of plastic magnesia are in the Eastern States, whereas the only producing districts of the country are in California and Washington. On the other hand, large supplies of good dolomite are available in the East and the Bureau of Mines tests have shown that recarbonated dolomite makes very satisfactory stuccoes. Dolomite does not contain enough magnesia for flooring cements. However, since 80 per cent. of the plastic magnesia sold is used for stucco,

recarbonated calcined dolomite could satisfactorily supply most of the demand for plastic magnesia.

Research undertaken to show the suitability of Washington crystalline magnesite for the manufacture of plastic magnesia, while accomplishing its purpose definitely and satisfactorily, incidentally discovered a process for using dolomite in magnesian mortars which may well prove commercially important. This discovery indicates a use for vast deposits of pure dolomite near eastern consuming centers and may revolutionize the magnesian mortar industry.

The results of this investigation are contained in Bureau of Mines Bulletin 236, "Plastic magnesia," by Oliver C. Ralston, Robert D. Pike, and Lionel H. Duschak, copies of which may be obtained from the Superintendent of Documents, Washington, D. C., at a price of 30 cents.

ENTIRE NATION WILL OBSERVE "GOOD ROADS WEEK"

*Civic Celebrations to be Held at Many
Points in Connection with Big Road
Builders Convention in Chicago,
Jan. 11-15*

Various highway associations, motor clubs, commercial bodies and road contractors and material men's organizations have adopted resolutions pledging their support to the movement sponsored by the American Road Builders' Association, for the observance of "Good Roads Week" throughout the country, Jan. 11 to 15, inclusive. The local celebrations will be staged in conjunction with the great good roads convention to be held in Chicago that week attended by 30,000 delegates from governments, states, counties and cities in this and Pan-American countries. Not only will this convention and the "Good Roads Week" celebrations be held under the auspices of the Road Builders' Association but the latter organization is promoting also a great exposition of road building and maintenance machinery, methods, materials and appliances to be housed at the Chicago Coliseum the same week.

Extensive arrangements for the observance of "Good Roads Week" are being worked out for public and private schools, engineering colleges, civic and fraternal organizations, motor clubs and automobile associations, highway bodies, chambers of commerce, boards of trade and other instrumentalities. The local celebrations, as well as the Chicago convention and exposition, are expected to add a great stimulus to the nation's program of highway improvement now so closely allied and interwoven with the development of

the automotive industry.

The governors of all the states, the governing boards of the counties and the mayors of the cities are being requested by W. H. Connell, president of the American Road Builders' Association, to send three or more official delegates to the big dual event in Chicago. The United States Bureau of Public Roads is taking a great interest in the convention and will have a big exhibit at the exposition.

Arrangements for both "Good Roads Week" and the Chicago convention and exposition are being handled from headquarters of the American Road Builders' Association in New York, Chicago and Raleigh, N. C.

STRENGTH OF HOLLOW TILE WALLS DETERMINED BY BUREAU OF STANDARDS

*Seventy Walls Crushed in Largest
Testing Machine in the World*

An investigation has recently been completed at the Bureau of Standards, Department of Commerce, on the strength of seventy hollow tile walls. The tiles were secured from widely separated regions in the eastern United States and covered practically the entire range in quality of clays used for making hollow tiles. These walls were crushed in the largest testing machine in the world, which can exert a force of 10,000,000 pounds. The results of these tests will enable engineers and architects to use this valuable building material properly since the wall strengths themselves were actually found.

The average person gives little attention to the various types of construction used in the buildings which house and shelter him. It is usually assumed, without question, that the strength of all of the members which make up structures he enters, is adequate for the purpose used. In almost all cases this is true, yet few realize that this is not so by accident but is the result of many years of experience and research. The necessity for and the serious attempts to secure more economical construction by reducing the amount of materials used has made necessary strength tests of the sort just described.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

The BUILDERS' GUIDE is in its fortieth year of continuous publication.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Sugar Cannot Harm These "ANTI-HYDRO" Protected Concrete Floors

The concrete floors in this building are subjected to a sugar condition which would ordinarily deteriorate them. To make the condition even worse, heavily laden sugar trucks are continually passing over these floors.

But "ANTI-HYDRO" has so thoroughly hardened the concrete that it is absolutely impervious to the action of the sugar, and withstands the trucking as well.

For 21 years "ANTI-HYDRO" has stood up under the most severe conditions. Use it on your next job for permanent results.

As The Editor Sees It

ANNUAL CONVENTION OF THE AMERICAN INSTITUTE OF STEEL CONSTRUCTION

Definite steps to further the progress of the structural steel industry by means of closer internal co-operation, by the application of the most approved business practices, and by the education of the public in regard to the advantages of structural steel marked the annual convention of the American Institute of Steel Construction held at White Sulphur Springs, West Virginia, last month.

The members of the Institute to the number of 160, together with a number of the country's foremost engineers and architects attending the convention as guests, were welcomed by C. Edwin Michael, President of the Virginia Bridge and Iron Company, Roanoke, Virginia. Mr. Michael reviewed the achievements of the Institute in the past, including the formulation of the 18,000 pound unit of working stress and the code of standard practice, and then outlined the steps which remain to be taken or encouraged by the Institute.

Striking the Keynote

The keynote of Mr. Michael's address, and in fact of the whole convention, was

struck, when in summing up, Mr. Michael said, "Sectional and group co-operation of members is necessary to eliminate duplication of expensive practices. Accurate cost finding, modern selling methods, economical distribution, and a campaign of intelligent and forceful publicity promoting the use of structural steel are essential for the success of all engaged in the industry." Mr. J. L. Kimbrough, President of the American Institute of Steel Construction replied to the address of welcome.

During the business sessions that followed, the passage of a number of resolutions and the adoption of a new budget gave the board of directors the authority and the means to initiate a program of activity involving the recommendations made by Mr. Michael. This constructive action, according to the officers and directors of the Institute, makes the 1925 convention a mile-stone in the career of the American Institute of Steel Construction and in that of each individual member.

Technical Discussions

Aside from the strictly business sessions, a considerable portion of the convention's time was devoted to discussions of various technical phases of the indus-

try. R. A. Storm, Manager of the structural department of the Morgan Engineering Company, Alliance, Ohio, delivered an address on "Electric Arc Welding and Its Application To Structural Steel" in the course of which he stated that tests conducted by his company in connection with the erection of an electrically welded frame for a twelve story building in Detroit showed that the joints held until they were subjected to nine times the safe load.

Speaking on the use of steel in residences, farm buildings, garages, and small apartments, Henry R. Brigham, Chairman of the Housing Committee of the National Association of Real Estate Boards, stated that such construction offered an almost untouched field for the expansion of the structural steel industry. As an illustration of the practicality of steel frame construction for such buildings he cited the fact that a builder who is now building small houses with steel frames and metal laths has found that the cost of the steel for a six room bungalow is about \$75 less than the cost of wood joists, rafters, studs and laths.

in the structural steel industry was emphasized in a paper by Dr. George F. Swain, Professor of Civil Engineering, Harvard University. A paper by H. A. Frommelt, Consulting Engineer of Milwaukee, Wisconsin, urged the adoption of the apprenticeship system in the building trades. Among the other addresses delivered before the Institute were:

"The Fireproofing of Structural Steel," by B. C. Collier, President, Cement-Gun Company, Inc., Allentown, Pa.

"An Investigation to Determine the Cause of Rivet Failures in Driving," by A. L. Spencer, Jr., Pittsburgh Screw and Bolt Company, Pittsburgh, Pa.

"My Experience with Concrete and Steel in Building Construction," by Albert C. Martin, Architect and Engineer, Los Angeles, California.

"Structural Steel in Earthquake Areas," by John L. Clymer, Manager, Northern California Division, California Institute of Steel Construction.

"Tests of I Beams Encased in Concrete," by Dr. H. M. McKay, Dean Faculty of Applied Science, McGill University, Montreal, Canada.

"The Structural Steel Industry and Its Future," by H. A. Fitch, President, Kansas City Structural Steel Company, Kansas City, Kansas.

Elections

J. L. Kimbrough, Indiana Bridge Company, Muncie, Indiana, was re-elected president of the Institute for the ensuing year. The other officers—W. M. Wood, Mississippi Valley Structural Steel Company, Decatur, Illinois; Charles F. Abbott of New York; and Lee H. Miller, of Cleveland, Ohio—were re-elected vice president, executive director, and chief engineer respectively. C. E. Michael, Virginia Bridge and Iron Company, Roanoke, Virginia, was elected to the new office of second vice president.

The following were elected as new directors: W. S. Mosher, Mosher Steel & Machinery Company, Dallas, Texas;

R. Llewellyn, Llewellyn Iron Works, Los Angeles, California and C. E. Michael, Virginia Bridge & Iron Company, Roanoke, Virginia. N. W. Warren, Dominion Bridge Company, Montreal, Canada, was elected to fill the unexpired term of E. S. Mattice, Canadian Vickers, Ltd., Montreal, Canada.

The five men who formulated the standard specification of the Institute involving the 18,000 pound unit of working stress were elected as the first honorary members. Their names are: G. F. Swain, Professor of Civil Engineering, Harvard University; M. S. Ketchum, Dean of the College of Engineering, University of Illinois; E. R. Graham, of Graham, Anderson, Probst & White, architects, Chicago, Illinois; W. J. Thomas, Chief Engineer, G. B. Post & Sons, architects, New York, and W. J. Watson, President, Watson Engineering Company, Cleveland, Ohio.

THE TOLL OF JURISDICTIONAL DISPUTES

By JOHN J. DAVIS, *Secretary of Labor*
I am interested in the National Board of Jurisdictional Awards. I am interested in it for a number of good reasons. And I am warmly interested.

As I see it and from the information I gather, it is a representative organization. It represents every party and all parties to a jurisdictional dispute. If all parties are not in, there is plenty of room for them to get in. I am interested in this Board because it was suggested by labor and it was started by John B. Lennon, a commissioner of conciliation who was directed to do so by the then Secretary of Labor. That was in 1918. This Board has settled hundreds of these jurisdictional disputes since then, and has saved millions and millions of dollars for the American people. The whole country is interested in this Board. The need of this Board is plain to all. The

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

(Continued from page 772)

whole country looks to it to save the building industry, one of the biggest industries we have, from being shot to pieces by these jurisdictional disputes. Why shouldn't we have peace in this industry, when it isn't a question of whether union labor shall have the job, but which union shall have the job?

Enthusiastic Approval

Reading the reports of my predecessor in office, I learn that in forming this Board, Commissioner Lennon got the enthusiastic approval of architects, builders, and men of the building trades in the American Federation of Labor. The thing was a success from the start. Conferences were held in New York, Chicago, St. Louis and other large cities of this country. The idea was to get some standardization of craft work, and progress was immediate. This Board took formal shape in 1919. As I say, in 6 years it has saved the country untold millions in the disputes it has settled. That is progress. But these disputes go right on. This Board has plenty of work yet to do. Plenty of progress remains to be made.

Some building trades have accepted the awards of this Board. Others would not come along. That means that every encouragement must be given to extending the activities of this Board of Awards. All parties should abide by its decisions. This is no "star chamber" outfit. All parties are represented here. And parties have a chance here to get up and say their say. And when an award has been handed down here, all parties should accept that award and carry it out.

I don't know of anything more disheartening to a workman than to set out in the morning not knowing whether or not he is going to get a day's pay, because one of these jurisdictional disputes may be on. I don't know of anything so disheartening to the owner of a building, the man who is paying for it, or to the contractor who employs the men to build it.

All parties connected with the enterprise of raising a new building can sidestep the responsibility for these disputes, but it is usually the workman who in the end gets the blame for stoppage of work, and organized labor suffers from it.

The contractor, the subcontractor, the architect, the owner, the financial organizations paying the bills, are all innocent losers in a situation not of their making. I know many men who are anxious to build, and afraid to build because of these jurisdictional disputes. They know full well they have only enough money to complete the building, and can't afford to pay interest charges caused by delay when two or more building trades are at loggerheads over which of them shall perform some item of work. It also affects the bond sales and maybe after a time we shall not be able to finance a building because of these disputes.

The fact is, these jurisdictional disputes have become a matter of grave concern to the whole public. The whole business and industrial machinery of the country is upset as one after the other important factors in the national building program are subjected to loss by these wrangles and stoppages of work. The loss begins with the wages of the trades in disputes. It spreads and spreads until large sections of the public are out of pocket. That sort of thing, if long continued, can slow up the building program of an entire section of the country. When loss comes in a package of that size, it has a bad effect on business generally. It is impossible to overemphasize the bad effects arising from one of these jurisdictional disputes. It is just as hard to emphasize the importance of getting them settled and stopped as promptly as possible. And the worker himself can't get out of his part in getting them settled.

I don't know of anything that has done more to destroy the chances of organized labor to deal with large organized industrial interests than these civil wars among the unions. Organized labor has withstood destructive assaults, within and without its own ranks. It should root out the jurisdictional dispute. Here and there people are seeking to break the trade union movement in America, but so long as the trade union movement stands true to its principles and deserves the support of its membership and the public, it will get that support. It cannot be destroyed. But like other movements in this or any other country, organized labor can commit suicide through internal dissension. And these jurisdictional disputes are just that form of suicide.

It can't be denied that these jurisdictional disputes supply those who are opposed to organized labor with just the propaganda they want for refusing to deal with the unions.

Settle these disputes among yourselves, and without stoppage of work.

That is profitable to all—to the workers, the builders, the owners.

Hurts Labor Generally

It is only the building trades that are directly affected by these so-called jurisdictional disputes. But I don't know of anything that has done more to hurt labor in general. In talking with the head of a great manufacturing enterprise as to why his labor wasn't organized, he said to me, "We have more classifications in our industry than there are in the building trades, and if we were dealing with the several unions, their jurisdictional disputes would ruin our business. In the building industry, losses of that kind can be taken care of by directly taxing the people, by increasing rents, and so on. But our competition is keen, and we have no way of making up losses that might result from jurisdictional disputes, and we can't take any such chances."

You see the bad effects of these disputes don't end with the building trades, but reach out into other industries. In the long run they come right back and injure unionism itself.

I realize that with new invention, improvements, changes in building materials and methods going on all the time, these craft disputes are bound to occur. Some of these are honest differences of opinion. But they have to be settled or we are in for wreckage all around. If the question in these disputes were only wages, working conditions, or other matters between workers and employers, there might be reason for stoppage of work until adjustment is reached. But in the case of which craft shall perform a given piece of work, the owner or employer is not at fault. He has no part in the dispute. He has entered into contract, and tradesmen have accepted certain terms and conditions of employment.

Entitled to Service

Therefore, in all fairness the owner-employer is entitled to labor's service even though the crafts have a difference among themselves. Our agreements call for unbroken work until the job is completed.

If the crafts can't agree, then the matter should go to this Board of Awards in which all are fairly represented. While the difference is being settled, work should go on. And when the Board has decided the question, the decision should be accepted. The resulting chaos if we don't set up and abide by this machinery is plain to all.

We cannot stop progress. Recently I visited several points in Europe and saw many buildings, but I was particularly impressed by one new form of steel construction.

Under this process a steel house is constructed in five weeks by common labor at a cost of about \$2500. I cite this simply to illustrate the changes in building

that are always going on, and to emphasize the need of this Board to settle these disputes. So long as the building industry continues to progress we need to rely on this Board of Jurisdictional Awards, or we all go to destruction.

There are angles to this hold-up habit in building that I can't go into here, but of all the human elements that enter into it, the workman always gets the blame. The jurisdictional dispute is a blot on the fair name of trade unionism. Organized capital doesn't fight itself. It fights its enemies. Trade unionism should stop fighting itself and fight for its best interests. These constant stoppages are costly. They cost the worker, not only in loss of wages, but in constant assessments that the fighting may go on. Every loss caused by these disputes comes home to the worker because every additional cost to a building is paid in higher rents and purchases. These fights are even cutting down work, in frightening people from building.

Here is the case in a nutshell. Invention and change in building methods are going to go on. So long as progress goes on, jurisdictional disputes are bound to occur. The thing is to get them settled. Here in this Board of Awards is the machinery to get them settled. We all have a part in that machinery, and if we don't run it we go to destruction.

After all, the American worker is a business man. We have got to rely on his business sense to refer to this Board all matters in dispute. We must appeal to his business sense, his sense of profit and loss, to stay on the job and finish the job until his difference is ended.—*The Constructor*.

THE IMPORTANCE OF COLOR IN THE HOME

Man has more in common with the chameleon than he suspects. True, he does not change color to match his surroundings, in exactly the same way, but a gray, murky day usually entails gloominess, likewise clear, sunny weather has an enervating effect. He reacts similarly to color. Red is irritating and blue has a trick of producing that state of mind which takes its name from it—the "blues."

How much depends upon our color happiness is not definitely known. Scientists who have experimented with the matter, however, have found that guinea pigs thrive better in cages painted in light colors than in those painted a darker hue. Plant life is known to react strongly to certain colors, to the extent of actual retardation or exhilaration of growth. At any rate, all of us know that certain colors appeal to us and that others do not. The effect upon the nervous system of living, day in and day

out, with discordant colors is far reaching, although the individual may not be conscious of the cause of his depression or irritability.

Interior decoration, therefore, is not totally a matter of aesthetics. Good color arrangements have their place in the health and happiness of the family, and when I say "color arrangements" I mean the proper color for the proper place. A misplaced color is as jarring to the nerves as a discordant color.

Color can determine the appearance of a room. It can also determine what we may call the spiritual quality which it possesses, that is, its atmosphere or personality. A large room with a northern exposure, decorated in blue or green, or certain formal shades of gray would be difficult to live in. The cool colors—green, blue, gray, and their shades and hues—are also receding. They give the effect of space. A large room already has space and a northern exposure is already cold, so that the combination of color and location results in an inappropriately decorated chamber that must be uncomfortable to the sensitive.

Warm colors, which have the effect of reducing the apparent size of a room, would neither emphasize the impression of space nor would they enhance the chilly atmosphere. Brown, yellow, orange, amber gray, certain shades of red-brown, are appropriate.

In painting walls, as so many people are doing nowadays, a flat finish is not the only type that can be used. Many rooms look best with such a finish, but others need variety and vivacity. A small room, cut up into various angles and planes, such as one often finds in old houses, has sufficient variety of arrangement actually to need a plain wall treatment, but the average room, with unbroken expanses of wall needs the relief of color variety.

Here two or three color effects may be used, or panelling, or any of the other devices for breaking upon a bleak expanse of plain color. Textured paints add much to certain rooms in the way of warmth and variety.

A small room can be made to look larger, the chill and formality of a large room may be reduced, a dark room can be made lighter and a too bright room may be toned down by the appropriate use of color. In nearly every house there is a small back room with one window, through which a small amount of light seeps in. Dark walls and furnishings simply emphasize the smallness and darkness of the place. Paint the walls a light cream or sunny yellow or delicate primrose, and the room will almost expand before your eyes. Light colors reflect light while dark colors absorb it. For that reason, light walls in a dark, poorly lighted room, make the most of

the little sunshine that comes in the window.

One of the problems in decorating a bedroom is to make it appear cool and restful in summer and warm and comfortable in winter. Where the sun shines brightly all day, cool colors automatically suggest themselves, and, indeed, they are totally satisfactory in warm climates or in the summertime. To make the decoration of such a room adjustable is not a matter of having two sets of hangings, rugs, and appointments, but of selecting a color combination that is comfortable all year around.

Decorators have a number of proverbs and one, I believe, may be safely adopted by all—"When in doubt use gray." This color is soothing and restful. It is appropriate in any room, harmonizes with almost any other shade or tone, and may be either warm or cool, according to the need of the room. For the bright room, then, walls of soft gray, slightly shaded with amber, are suitable. These walls may be panelled to break up the planes or misted over with a faint spray of yellow or orange. Blue and yellow curtains, in cretonne or other material are appropriate; in some cases a successful treatment is to use window curtains of sheer blue material and overdrapes of sunny yellow. In this way, a warm color is preserved for winter, when every bit of sunshine must be made the most of, and, in the summer, the cool blue and gray are there to diffuse the sense of warmth.

The dining room is another problem. Since it is not in constant use brighter colors can be used there than in any other room, yet, since meals involve a certain ritual, it must preserve an air of formality. The best solution that I have seen is in a small suburban home that was decorated by a clever young woman with a very accurate eye for color. The room was of medium size and on the west side of the house, so that it received sunlight part of the day. The walls were panelled very formally and the whole painted a rich buff. The woodwork was brown to harmonize with the furniture. The areas within the panel moldings were given what is known as a spatter treatment of cream and dark buff. The colors gave warmth to the room while the formal panel treatment preserved the essential stately atmosphere. Another attractive dining room had rough walls of cream texture painted, a floor of painted terra cotta laid out in squares bounded with stripes of black and black woodwork. This was a cottage dining room, however, and small, so that the very unusual treatment did not look bizarre or "tea-roomish."

Remembering the effect of color upon light and apparent space, the living room is the easiest room in the house to decorate. A solid color is not so successful

here as it is in a less used room. Break up the walls with a play of color. Gray buff or gray green may be used as a foundation color and harmonizing or contrasting colors played over it in one of the new techniques. For a large living room without continuous sunlight, warm gray or buff with a rhythmic arrangement of yellow, orange, cream or terra cotta red in one of the new techniques gives it vivacity without ostentatious brilliance, warmth, and a feeling of comfort. For the sunny living room there is no more charming color than gray green. This could be used on the woodwork as well but in a little darker shade. Cream, pale yellow, or faint lavender are good contrasts for it.

Bedrooms are adaptable to all over spatter, misted or mottled finishes, since these are restful and informal. Panelling, plain finishes, or two color finishes in a technique that gives a larger rhythmic pattern than misting, for instance, are suitable for the dining room, living room or hall.

Low ceilings are sometimes a problem, likewise those so high that they give the feeling of living in a railroad terminal. To make a low ceiling appear as high as possible, run the wall color directly up to the ceiling, omitting picture molding. A border of a darker or contrasting color may be put where the wall and ceiling meet, but not below it. The high ceiling can be tied in with the room by carrying the ceiling color down the wall some two feet and finishing it with a molding or stencilled border. Or if the walls and ceilings are the same color, a stencilled border or painted molding about two feet down from the ceiling will help break the thrust upward.

The trouble with many rooms is that the ceiling is white or cream without regard to the rest of the decoration. This naturally lends a discordant note, and, in the case of a high ceiling, makes it appear even higher while in a low ceiling it brings an unrelated tone too close to the rest of the decorations. Give the ceiling a pale shade of the dominant tone of the room. If you have a gray and henna living room, the ceiling should be pale gray. If the dining room is buff and blue, make the ceiling a warm, rich cream. If the bedroom is lavender or orchid, a pale shade of either color will look well on the ceiling. In other words, keep the ceiling light in tone, but tint it to match the rest of the room.

Much depends upon the woodwork also. White enamelled woodwork is charming, but not in every room. Where the room is large and the woodwork of handsome design, it may be made prominent by using a very light or very dark color upon it, but in the small room, such accentuated contrast is apt to make the woodwork stand out like an angular

spider web. Keep the woodwork either in harmonious contrast with the walls or in the same key. For a room painted green gray green woodwork is delightful. Cream woodwork is good in a room painted buff, likewise pale yellow in the blue room.

Another thing to remember in decoration is that rooms are not isolated compartments but part of the whole house. I once saw a beautifully decorated room in the loveliest shade of red brown. It fairly breathed comfort and hominess and I was delighted with the taste and discretion with which this difficult color was used, until someone opened the door into the dining room. What a shock. The whole charming atmosphere was ruined because there, through the door, was a light, airy and wholly discordant dining room done in gray and blue. The transition from the warm living room to the aloof dining room was too rapid. It was confusing and the result was that neither room appeared at its best.

The fundamentals of good taste do not change. These few rules for the use of color and the decoration of certain rooms are instinctively known by everybody because they are fundamental. Fads and fashions lead us into pitfalls and before we realize it, our homes are finished in a manner not in the least in harmony with our basic tastes, color is one of the true joys of life. Everybody responds to it and everyone has his preferences. It is fortunate that there is a place for all of them in the grand system known as color schemes.—*Keith's Magazine*.

At a conference of building interests, technical representatives and manufacturers of glass sidewalk and roof lights, held recently under the auspices of the Division of Simplified Practice, Department of Commerce, action was taken to have six sizes, two shapes and five styles replace 80 styles, 120 sizes and 10 shapes previously made in this commodity. The action will become effective March 1, 1926, but in the meantime various makers of these commodities will put the program into effect as rapidly as possible.

The meeting brought together representatives of the American Ceramics Society, National Association of Building Owners and Managers, American Railway Engineering Association, American Electric Railway Association, American Institute of Architects, and of building and safe walk code committees. E. W. Ely of the Division who presided, read a score or more of letters from other associations who were in accord with the proposed reductions, but who were unable to have representatives present.

Davis Carpenter, of Davis Carpenter & Co., New York City, chairman of the simplification committee of manufacturers, presented the program, which repre-

sents an average reduction of 90 per cent.

LeRoy Kern, technical secretary of the American Institute of Architects, New York City, raised several questions from the viewpoint of the architect, to clarify the matter of thickness of glass, and of the supporting edges, and as to surfaces. These were answered by Mr. Carpenter and C. H. Paschall of the American 3-Way Luxfer Prism Company, Cicero, Ill., who explained that the industry is seeking in its standardization program, to provide ease of replacement. It was explained further that the policy of manufacturers has changed in the last three or four years, from one of producing something 'different' to a policy of providing sizes and stocks which would permit interchangeability with a minimum of time and effort. There still exists a demand for some of the old sizes, which must be carried for maintenance until the old equipment has worn out.

The three sizes adopted, it was stated, will meet 90 per cent. of today's demand; and the spacing of glass has been developed in a manner which will give the greatest strength without breaking.

L. Willard Mulford, of the American Bar Lock Co., Inc., New York City, stated that the glass light industry has also developed a relatively new method of setting sidewalk glass in place, using a metal rim, instead of placing it directly in a concrete setting. This, he said, makes for greater safety, and long service, virtually permitting all companies installing such glass to guarantee their work, and make free replacement of broken glass for five years. His company, he reported, had had to replace but 24 pieces of glass in installations amounting to more than 1,000,000 pieces during three years.

It was declared both by Messrs. Mulford and Paschall that the simplification program combined with the standard method of placing such glass in position is aimed at restoring the industry to its former position; the manufacturers admitting that they had been in error in their installations before the adoption of the cup system of mounting or setting such glass in place.

Dr. R. B. Hunter of the Bureau of Standards, P. P. Cartwright of the Building Code Committee, Department of Commerce, and Alfred N. Finn, of the American Ceramics Society, discussed the program as relating to safety in walking, the building code needs and problems as to the technical qualities of the glass used. It was decided by the manufacturers to have a committee represent the glass sidewalk industry in the Safe Walk-way Surfaces Code Committee, which is sponsored by the American Institute of Architects, the Society of Safety Engineers and the American Engineering Standards Committee.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

write practically every form of insurance except life

AMERICAN SUGAR REFINING CO. JERSEY CITY.

Sugar Cannot Harm These "ANTI-HYDRO" Protected Concrete Floors

The concrete floors in this building are subjected to a sugar condition which would ordinarily deteriorate them. To make the condition even worse, heavily laden sugar trucks are continually passing over these floors.

But "ANTI-HYDRO" has so thoroughly hardened the concrete that it is absolutely impervious to the action of the sugar, and withstands the trucking as well.

For 21 years "ANTI-HYDRO" has stood up under the most severe conditions. Use it on your next job for permanent results.

As The Editor Sees It

PROGRESS IN ELIMINATING WASTE BRINGS ECONOMIC TRANSFORMATION

Progress the United States has made during the past five years in the elimination of industrial waste on a national scale has brought about "one of the most astonishing transformations in economic history," according to Secretary Hoover, whose annual report, made public today, surveys American industry in support of this contention.

"What the country as a whole has accomplished during the past five years in increased national efficiency in these directions is impossible of measurement," says Secretary Hoover. "Nor does the Department of Commerce lay claim to credit for the great progress that has been made save as we may have helped to organize a definite public movement. That movement is the result of a realization by every group—business men, industrial leaders, engineers, and workers—of the fundamental importance of this business of waste elimination.

"In addition to elimination of waste we have had the benefit of notable advances in science, improvement in methods of management, and prohibition. Thanks to elimination of waste and these

other contributing factors, we can as a nation show one of the most astonishing transformations in economic history."

The Secretary then calls attention to figures from the Department of Labor indicating that whereas in 1920 the wage rate was 99% above pre-war and the wholesale price level 126% above pre-war, in 1924 the wage rate had risen to 128% above pre-war, while the wholesale price level had dropped to 50% above pre-war.

"While wages are higher than in 1920, wholesale prices are lower," he explains. "We thus have the highest real wage in our history, and we have had three years of remarkable price stability."

Comparable British figures are quoted to prove that these results are peculiar to the United States. The British wage rate in 1920 was 130% above pre-war and the wholesale price level 183% above pre-war, while in 1924 wage rates and wholesale prices had dropped to 70 and 74%, respectively, above pre-war.

Discussing the fundamental purposes of this campaign for waste elimination, Secretary Hoover says:

"The philosophy that underlies it has but one purpose; that is, to maintain American standards of living for both

workers and farmers, and to place production on a more stable footing. The high standards of living enjoyed by the American people are the result of steadily mounting per capita productivity. There is only one way to further advance these standards, and that is by improved methods and processes, by the elimination of waste in materials and motion in our production and distribution system.

"Just as 20 years ago we undertook nation-wide conservation of our natural resources, so we must today even more vigorously sustain this campaign of better nation-wide utilization of our industrial resources and effort. More especially is this the case in view of the many complex forces which have arisen from the war, and particularly the difficulty of maintaining our situation as against the competition of a world of lower standards overseas."

The activity of the Department of Commerce in this field of waste elimination is indicated by the fact that since the work was launched on a large scale in 1921 some 900 group conferences have been held under the auspices of the Department, practically all at the request of the industries themselves, while upwards

of 200 committees are now at work in cooperation with the Department on various phases of the program.

At this point in the report Secretary Hoover introduces, as it were, various officials of the Department in touch with the different industrial and commercial fields and lets them tell for themselves the progress that has been made in each during the past five years. Some of the accomplishments noted are: greater efficiency of the railroads, a sixty per cent increase in electric generating capacity, wider provision and use of business statistics as a stabilizing influence reducing speculation in commodities, the expansion of industrial research, the extension of the building season in the construction industries, and millions saved through "simplified practice."

IMPROVEMENT IN RAILWAY TRANSPORTATION

Eugene S. Gregg, Chief of the Department's Transportation Division, reports that one of the most important contributions to the elimination of waste has been the remarkable improvement in railway transportation.

"The first factor in that improvement was the provision of adequate transportation itself," says Mr. Gregg. "The periodic car shortages of many years past have practically disappeared, although the tonnage loaded has increased more than 25 per cent since 1921. The waste imposed on carriers and public in those periods of shortages in transportation amounted to hundreds of millions annually. A second improvement, aside from direct increase in facilities, has been the very great and fundamental increase in efficiency of operation. Since 1921 the average weekly car loadings have increased from 693,533 to 986,475, the number of miles per car per day from 22.4 to 26.9, the average trainload from 656 to 731 tons."

INLAND WATERWAYS

Improvement of our inland waterways

is discussed by Paul S. Clapp, special assistant to the Secretary, who calls special attention to the work of the St. Lawrence Commission, which is considering the project to open a route between the Great Lakes and the ocean. A joint engineering board is actively at work on the engineering aspects of this undertaking, and at the same time the Department of Commerce has in process a critical economic study of its possible effects and benefits. Turning to the Mississippi Valley Mr. Clapp declares that "it is of the utmost importance that we accomplish the earliest possible completion of the Mississippi system of waterways in order that cheaper waterborne traffic in primary and bulk goods within this great mid-west area and in its egress to the sea, may contribute to restore its economic relationships to the rest of the country."

GREATER ELECTRIFICATION

Mr. Clapp also describes the progress that has been made in the direction of "elimination of waste through enlarged electrification," of which he says:

"During the past five years there has been a notable advance in the electrification of the country and in the generation and distribution of power. This is being accomplished not only with an enormous saving in fuel, but with large increases in productivity, reduction of physical effort and labor, and added comfort in the home. Since 1920 long strides forward have been taken in the development of widespread electrical power systems, which are increasingly becoming the enormous reservoirs of mobile and reliable power for all purposes, upon which in such large measure our national progress depends. The cost of power has been maintained at pre-war levels, the large economies in production and distribution offsetting the rise in labor and material costs."

WIDER USE OF STATISTICS

William M. Stewart, Director of the Census, tells how during recent years

**"No hot water fo' mah dishes---
we surely needs one o' dem Tank Heaters."**

IT IS exasperating to the cook when somebody takes a bath before supper and leaves her in the lurch on the hot water question. The least a good cook or a good laundress can ask for is **PLENTY OF HOT WATER**, and it is so easily and so cheaply supplied with a

18" High. 40 Gallons
Capacity

NOVELTY TANK HEATER

Less than a bucket of pea coal or buckwheat coal in 24 hours keeps this little heater right on the job day and night—and the 40-gallon tank stays full of hot water. A minute's attention morning and evening is all that is necessary and the operating cost is but 5 cents a day—one-quarter as much as gas. (This is unprejudiced, for we make both kinds.)

We were the originators of this type of coal tank heater and there are now imitations. Install the **NOVELTY**, with its brick-lined fire-pot, baffled water-way, two-bar rocking grate and reinforcement rods at the sides. Look for the name on the door. In these days of many baths, the average household wants a **BIG** supply of hot water—a **FORTY GALLON** tankful constantly on tap. The Novelty is designed for this.

Get all the facts—now! Write or phone today for complete information, "Hot Water and Plenty of It." Address Dept. BG-12.

ABRAM COX STOVE COMPANY

Contract awarded John Pettijohn, Lynchburg, Va.

(Continued from page 788)

statistics have been put to work to enable the business community to avoid the extremes of the business cycle. This development was largely the result of exhaustive research conducted by the Committee on Unemployment and the Business Cycle, appointed by the Secretary of Commerce in 1922.

"The Department, through the Bureau of the Census, inaugurated the monthly Survey of Current Business in 1921," Mr. Steuart points out, "and has been building up that publication ever since, with the aim of collecting all this type of

information and making it promptly available to the business community.

At the same time the census of manufactures was reorganized to point it more directly to these purposes. The Department has also developed a large informational service through Commerce Reports, issued weekly, and the Commerce Yearbook, issued annually, together with numerous special reports of particular interest to different industries and trades. These services reflect the concentration of the vast collection of data from individual industries and trades, a considerable part of which has been recruited by the trades themselves."

IMPROVE PROCESSES

George K. Burgess, Director of the Bureau of Standards, reports on the work of that Bureau, which, since the war, has developed greatly on the side of industrial research into the elimination of waste in industrial processes, always in cooperation with the industries themselves.

"Through these researches," says Dr. Burgess, "ways and means have been found for the better utilization of our raw materials, for cheapening and improving the quality of manufactured articles, and for turning to useful purposes by-products of industrial plants. Recent progress in this field of waste elimination may be illustrated by the experiments in chrome tanning for shoe soles, which increases the time of wear; the studies of crazing of pottery, which cuts down seconds; and the demonstration of the practicability of the commercial production of levulose, which may result in a new American industry.

ELIMINATING WASTE IN THE CONSTRUCTION INDUSTRY

A conspicuous example of definite accomplishment in waste elimination, with the Department assisting, has been in the construction field. Construction bears a peculiar relationship to the whole economic fabric, because the industries dependent upon it for the disposal of their products—lumber, steel, cement, and so on—form so large a section of our national economic structure. In 1923 Secretary Hoover appointed a committee to investigate seasonal operation in the construction industries and see if the wastes due to the seasonal character of those operations could not be curtailed.

"The better understanding of the problem brought about by the committee's report and the cooperative activities in

many localities have all had a marked effect," says John M. Gries, Chief of the Division of Building and Housing, in reviewing accomplishments in this field. "Activity of a large number of contractors on operations throughout the country averaged about a third greater during the three winter months of 1924 than in previous years. The far-reaching practical effect of such developments has been demonstrated during the past year, when the total amount of construction reached a value of more than \$6,000,000,000, the highest in our history.

"Large building programs in the past usually meant rapidly mounting costs of construction. In this case, however, there was a greater equalization of building activity throughout the 12 months, and as a result the enormous construction program was executed with no marked labor shortage or serious pressure upon the building material, manufacturing, or transportation industries. The prices of most building materials, in fact, actually decreased."

Another development affecting construction has been the widespread adoption of American lumber standards, worked out by a committee appointed by the Secretary of Commerce in 1922. At the same time progress is being made in the grade marking of lumber.

In 1921 the Secretary of Commerce appointed a committee on Building Codes, whose exhaustive studies and reports have been accepted as authoritative and have been utilized widely in progressive revision of obsolete requirements in different cities. An Advisory Committee on Zoning, also appointed in 1921, prepared a Standard State Zoning Enabling Act which has been used wholly or in part by 17 states—"a fact which bears eloquent testimony to the value and far-reaching scope of the committee's work in this field," according to Dr. Gries.

SIMPLIFIED PRACTICE

Simplified Practice is another method through which the Department has been helping the industrial community to eliminate industrial wastes. "Simplified Practice" means the reduction of variety in sizes and dimensions of everyday commodities. It has nothing to do with style problems or matters of individual creation. The Division of Simplified Practice was established in the Bureau of Standards in 1921, and its chief is now Ray M. Hudson.

"Since this cooperative service was inaugurated over 50 simplifications have

been achieved by the industries and trades concerned, resulting in an average reduction varieties of 73 per cent," Mr. Hudson reports. "The annual value of manufactured goods affected by these

simplifications runs well over two billions. In eight typical cases leaders in the fields covered have estimated potential savings from simplification as follows: Paving brick, \$1,000,000; sheet steel, \$2,400,000; steel reinforcing bars, \$4,500,000; warehouse forms, \$5,000,000; range boilers, \$5,500,000; builders' hardware, \$10,000,000; inquiry, purchase order, and invoice forms, \$15,000,000; and lumber, as high as \$200,000,000."

OTHER WASTE ELIMINATION ACTIVITIES

Dr. Burgess tells how the Federal Specifications Board, in cooperation with the Bureau of Standards, is eliminating wastes by drawing up standard specifications. Julius Klein, Director of the Bureau of Foreign and Domestic Commerce, describes the rise of the farmers' cooperatives and the efforts of the Department to help eliminate waste in do-

mestic distribution. Henry O'Malley, Commissioner of Fisheries, cites concrete examples of savings in the fishing industry. A. B. Barber, Director of the National Conference on Street and Highway Safety, of which Secretary Hoover is chairman, instances the mounting curve of human, material, and financial losses due to street and highway accidents as "one of the most conspicuous examples of waste in modern American life."

Construction operations during the next three months will be sustained at a greater volume than that held during the cold-weather period of any previous year on record, according to indications presented by statistics compiled by the Associated General Contractors of America. It is pointed out that construction operations in November maintained a level higher than the mid-summer plane of 1924, and this despite declines that asserted themselves during the preceding sixty days. Also, the fact that contracts awarded in October mounted to record-breaking figures for the month presages the activity that may be expected to develop if especially severe weather does not upset the program.

The total volume of construction performed during the first eleven months of 1925 exceeds by nine per cent the volume

of building during the corresponding period in 1924.

The average cost of construction in the principal building centers of the United States rose one point in November from the low mark to which it dropped in October. Since July the average of construction costs has been lower than at any time since the Spring of 1923.

The volume of contracts awarded continues to rise above all previous marks. October was the eighth consecutive month in which awards set new current-month records.

The volume of building permits issued in twenty principal cities during October was fifteen per cent greater than the September figure.

The average of wages in the construction industry remained stationary during

November. Prices paid by contractors for the basic construction materials rose two points during the month, reflecting price increases in several localities for lumber, brick and crushed stone, which were not entirely offset by lower prices for sand, gravel and cement, in some sections of the country.

A total of 95,000,000 square yards of concrete surface pavement was represented in awards made during the first ten months of 1925. This figure exceeds by more than three per cent the total awards in 1924.—*Bulletin, Associated General Contractors of America.*

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

Indemnity Insurance Company of North America write practically every form of insurance except life

You Can Pour Concrete In Freezing Weather When You Use "ANTI-HYDRO"

This entire building was constructed between November and February with the aid of "ANTI-HYDRO."

"ANTI-HYDRO" lowers the freezing point of concrete and cement mixtures to 17 degrees below the freezing point of water, making it possible to continue concreting, cementing and masonry work during freezing weather, instead of shutting down the job with a loss of valuable time and costly delays.

"ANTI-HYDRO" is an easy-to-use liquid integral compound which also permanently hardens and waterproofs concrete all in one operation. It mixes readily with the gauging water without the aid of skilled labor.

During 21 years of continuous use "ANTI-HYDRO" has never failed to live up to the claims made for it. Satisfactory results are guaranteed. Use it on your next job.

As The Editor Sees It

STABILIZING THE BUILDING INDUSTRY

BY W. J. LYNCH, V. P., THOMPSON-STARRETT CO.*

*Many Factors Work to Level Peaks.
Cost Is Less for Winter Jobs*

To treat the subject of stabilization in the building industry in a comprehensive way would require most careful study and analysis. It is my purpose only to mention briefly a few of the more obvious factors that influence the peaks and depressions of our business and to dwell more particularly on one important factor which is in our control to influence to a large degree.

The first requisite for stability in the industry is that the agencies which execute the projects shall possess qualities of skill, integrity and responsibility, qualities which the Associated General Contractors of America have chosen as their standard.

So equipped, contractors are prepared to receive and perform the nation's building.

*(Editor's Note—A paper presented before the American Construction Council and the Chicago Association of Commerce, Chicago, Nov. 20, 1925.)

Importance of Sound Financing

Their first concern should be to scrutinize the business offered and make certain that their services and materials are not to be utilized in producing structures either physically or financially unsound. The safeguarding of physical soundness may be largely left to the architects and the building laws of the state. A contractor who encourages the construction of projects financially unsound is a menace to his industry and a detriment to the community. The first responsibility lies with the bankers and mortgage loan houses. Insurance company loans are so conservative that projects financed by them are usually excellent, but if building work could proceed only on the conservative basis of insurance company loans, a tremendously vast volume of sound construction enterprises would never come into being. Hence, reputable financing organizations have provided the means necessary for owners with initiative, enterprise and foresight to produce this volume of business and they are entitled to the appreciation of the public for their contribution to the nation's progress and wealth. A high sense of responsibility to the purchasers of their bonds must animate their distinction be-

tween sound enterprise and unsound speculation, and any who disregard this responsibility should fail to receive co-operation from the construction industry.

The financing agencies and the construction industry would do well to guard against depressions that could be caused by sudden timidity of the public to purchase bonds due to the appearance in its midst of completed building projects that obviously fail to protect the integrity of their investments.

Influencing of Building Fluctuations

Peaks and depressions of the construction business are dominated by the economic conditions existing in general business and are not subject to our control, but in some respects we can influence the degree of these fluctuations.

Asks Honest Attention to Labor Problems

First, in our relations with labor. Capital and labor are necessary to produce the nation's material wealth, and co-operation between the two, rather than antagonism and distrust, will produce more fruitful results. We may be very critical of labor's practices and demands, and in some respects correctly so, but bear in mind that improvement cannot be induced by an antagonistic attitude and the

expressions of superficial and dogmatic opinions. Labor relations are among the most important phases of our business and yet are given probably the least intelligent and honest attention. A continued and intensive honest effort to induce labor to discontinue any wasteful practices and radical demands will be handsomely compensated.

This will require the expenditure of much time, application and energy because it is necessary to convince the other man that your program is devoid of pure selfishness and bears elements of justice and equity to him before he is prompted to provide the service and the conditions that will best serve your requirements. I do not believe that ideal relations can be achieved on this earth, but such vast improvement is possible as to warrant our most serious consideration.

Standardization Big Part of Stabilization

Standardization of materials is being sponsored by the Department of Commerce and other co-operative bodies. Much progress has already been made relative to reducing the tremendous variety of sizes of lumber. The tying up of capital in stocks of unusual sizes of various kinds of materials, occasionally specified but not essential to architectural nicety or structural soundness, is an economic waste and increases the general burden of cost.

It would be depressing if the choice of face brick, moulding of interior trim and other items susceptible of standardization were limited to few stock patterns, and such is not the intent, but much saving could be made by eliminating special dies and equipment and investment in unusual stock on hand, where adequate variety is already available in standard form.

The building industry has gone through a remarkable transition in improvement in utility of designs. The conception of the designer, the ingenuity of the builder and the contribution of new features by sub-contractors, material men

and manufacturers have resulted in improved types and character of structures. Continued improvement in the art will be one of the inducements to investment and a safeguard against depression. Standardization should be a helpful factor in this improvement.

Seasonal Work Greatest Sphere

Probably the greatest sphere of influence that the building industry can directly exert affecting peaks and depressions is in connection with seasonal work.

One of the important problems that has received considerable application during the past few years is winter construction. The increased volume of building contracts now being let involving winter construction indicates that the publicity given to the practicability of winter construction is producing effective results.

The theory that winter construction in the building industry must necessarily involve slow progress and prohibitive cost is being fast dissipated. The facts are that winter construction is not only practical but desirable, since it meets the owner's requirements of work of good quality executed expeditiously and economically. It reduces the high pressure of summer months and gives relief to the low pressure of winter months with direct benefit to owner, builder and labor, and consequent advantages to finance, manufacture and transportation.

It has become almost trite to argue the case, but constant reiteration of the facts to the general public is necessary for full conviction on its part to develop fully the effective results thus far accomplished.

It will be excusable, therefore, to briefly enumerate the elements which justify winter construction.

Quality can be dismissed without discussion for there is nothing else needed than competence to produce a quality of work in winter equal to that obtained in summer.

(Continued from Page 804)

As to progress, there are few days in the year when it is too severely cold to work. Through accustomed habit of thought people generally consider the winter weather delay is considerable, but investigation of numerous jobs indicates that in recent years in this climate delay due to severe cold and heavy snows has not amounted to a total of a week's time, and it would be a rare case to amount to more than 2 weeks. In thinking of weather delays in the winter, equal delays due to rain in the milder seasons are overlooked and it is my opinion there is little difference, if any, in amount of lost time between winter season and milder season work.

It is true that some divisions of the work cannot be completed as readily, such as removal of forms, which must remain a longer period, but on fair sized operations there are compensating advantages in that other branches of work are especially accelerated to minimize the inconvenience of the cold.

It will be conceded generally that the quality of work will be unimpaired and that work can proceed expeditiously, but it is urged that the cost is prohibitive;

first, because protecting the work in cold weather is very costly, and secondly, because the execution of the work itself is far more expensive.

Cost of Cold Proofing Is Small

The methods of heating materials and of preventing freezing of concrete while being poured and afterwards are well known and need not be discussed. Many people, including some contractors, lay considerable stress upon the increased

cost these precautionary measures add to the items of concrete and masonry and fail to consider how small a ratio the cost of all precautionary winter measures bears to the total cost of the entire building. Also, they do not consider the other divisions of the building, in many of which are minor elements of economy, the cumulative total of which offsets any heating and protective work required for concrete, masonry, etc.

Where the structure is entirely reinforced concrete the heating and protection cost is the greatest. Recent articles on this subject indicate the cost to run from 1½ per cent to 4 per cent of the total building cost based on jobs totaling \$50,000 to \$250,000, the percentages decreasing with the size of the job.

On a number of large reinforced concrete jobs running from \$1,000,000 to \$3,000,000, the writer has found the cost has run less than 1 per cent, and in only one case as much as 3 per cent.

On steel frame buildings with concrete arches the ratio is considerably less, and on steel frame buildings with tile arches it is, of course, still less.

Due to May 1st leasing in this territory the demand for completion prior to May 1st of large structures, which generally require a year's erection period, necessitates temporary heat for the interior work. The cost of temporary heat for interior work, including heat for construction materials, rarely exceeds one-half of 1 per cent of the cost of the structure.

As to the unit costs of actually executing the physical work, in an article in the *American Contractor*, a Milwaukee builder referring to a reinforced concrete building, makes the significant statement that while 60 per cent of all the concrete was poured in weather from zero to 20 degrees below zero, the very expensive cost of fuel and protection was offset by an increase in production of 10 per cent to 30 per cent more production per day per man. However, it is doubtful that others experience such favorable production results.

Survey Showed Winter Costs Favorable

The writer made a careful survey of the unit costs of concrete work, form work and brickwork on 5 large jobs, which clearly showed that the average unit cost of winter operations are as favorable, if not more so, than summer work.

It may be granted then that the cost of actual construction is as favorable in winter as in milder seasons, but the prospective owner still asks, "Wherein are to be found the economies and advantages to offset the cost of temporary heat and protection?"

Let us consider the condition that would exist if through some arbitrary law building contracts for each year were required to be let on some specific date, say May 15th. All the bargaining with

the bankers for finances would occur at one short period, the architects would all be getting out plans and specifications at the same time, contractors would all prepare estimates at the same time, then the structural plants, the quarries, the material men, the manufacturers and the railroads would be given their entire year's volume of construction business at one time, and last but certainly not least, each job trade would be required on all operations about the same time and released for succeeding trades as the work progressed.

Contemplate the tremendous increases in overhead, equipment, manufacturing capacity and transportation such a requirement would entail.

Consider the economic waste in idle labor, equipment, manufacturing plants and railroads in the interim between the delivery of the peak load and the commencement of the next year's volume.

In addition to the tremendous economic loss the investing public would have to bear, what influence would such a tremendous volume of business to be let at one time have on the market price of money and of materials and of labor, and what kind of a buying market would prospective owners find themselves in.

To contemplate such a circumstance is pure fancy, as its existence could only mean complete chaos.

However, in a comparatively minor degree, but nevertheless a very important degree, such periods do occur with consequent unstable material and labor costs.

The application of any prudent methods helpful in reducing or averting such periods will be profitable to all concerned.

It is perfectly patent that the greater the utilization of the instruments of business the lower the units of cost, and this applies directly to contractors' overhead, organization, equipment and labor. Giving contractors and material men and manufacturers an opportunity to utilize their idle business facilities in the usually quieter season of winter and thereby reducing the excess demands of summer, reflects in more favorable prices and more certainty of delivery in sequence as required.

And again last but not least, a very material gain is experienced with the job labor.

Reduce Labor Turnover and Average Costs Fall

One of the reasons for high wages in the building industry is the tremendous turnover and the contention of various trades that workmen have only seasonal employment due to the nature of the industry. Furthermore, scarcity of employment in the winter months is a deterrent to potential mechanics who would readily enter the trades, were there an all season demand for their labor.

Lack of constant employment during the year's period means a higher wage

rate per hour and excessive demand for labor in summer means still higher labor costs during the period of excessive demand.

The practice of letting contracts during all periods of the year would give greater utilization to the business instrumentalities of the industry, and produce a more normal flow of the volume of business for materials, for manufacturers, for transportation, for labor and for finances.

The foregoing circumstances insure to an owner that the additional cost of temporary heating and protection of materials for winter construction will be more than absorbed by the favorable costs of the other elements and divisions of work involved.

It may be confidently asserted that winter construction is not only practical but desirable, with direct benefit to owner, builder and labor and with consequent advantages to the community at large.

GOVERNMENT'S ACTIVITIES IN BUILDING

Building and Housing Department of United States Bureau of Standards Gives Annual Report of Work in 1925

The annual report of the director of the Bureau of Standards, George K. Burgess, was submitted to Secretary of Commerce Hoover this week and in it is included a resume of the year's work in the Building and Housing Department, of which Mr. J. M. Gries is chief. The chief activities of this department or bureau during last year were investigations on building codes, standard state zoning enabling act, standard state mechanic's lien act, home financing, statistical work and seasonal construction. The report summarizes these activities as follows:

Building Code Committee

The building code committee published its report, Recommended Minimum Requirements for Masonry Wall Construction, and Minimum Live Loads Allowable for Use in Design of Buildings. These reports were completed after consultation with architects, engineers, fire chiefs, building inspectors, contractors, building material manufacturers, and with numerous organizations representing these groups. Incorporation of these recommendations by municipalities in their building codes will, it is believed, promote more economical construction, while at the same time insuring ample safety. They embody the results of research and canvassing of opinion which make them of direct value in the design of a large proportion of the buildings erected in the United States each year.

Standard State Zoning Enabling Act

The use in at least 15 states of the de-

partment's standard state zoning enabling act, drafted by its advisory committee on city planning and zoning, has been most effective in guiding the zoning movement along sound legal lines and has obviated the need for duplication of legal research by legislative bodies. The advisory committee prepared a pamphlet comparing the use, height, and area regulations of the zoning ordinances in 10 selected cities, and a booklet on the usefulness of city planning in facilitating traffic, encouraging more careful utilization of expenditures for street and public works construction, and developing home sites at low cost. Drafting of a standard state act permitting municipalities to create city plan commissions was commended.

Standard State Mechanics' Lien Act

Drafting of a standard state mechanics' lien act which would be considered fair by all interests, and be suitable for adoption by the states, was undertaken at the urgent request of several representative national organizations. A voluntary committee of nationally known men representing contractors, labor, material men, financing agencies, real estate, architects, engineers, and the National Conference of Commissioners on Uniform State Laws is actively at work.

Preliminary studies of conditions relating to home financing, including some field work, were made. They showed that it is common for some seekers to face most disadvantageous financing conditions, especially in borrowing more than 40 to 60 percent of the value of the home. Discounts, fees, bonuses, commissions, or other charges often add several hundred dollars to the cost of a moderately priced house and are apparently entirely out of line with the risks involved to lenders in this class of loans as a whole. The situation differs in communities according to the existing financial structure; state laws relating to mortgages, conveyances and titles, and to financial institutions, local industries, and other variable factors. A number of communities have worked out fairly satisfactory solutions, and it is believed that if the facts could be made available upon which to base sound endeavors, substantial efforts would be made to improve conditions by individuals, building material manufacturers, and others especially interested in maintaining a high volume of residential construction.

Statistical Work of the Division

Statistical work of the division included obtaining monthly prices for 24 building material items as paid by contractors in about 50 cities. These prices were issued regularly and republished by a number of trade papers. The figures so obtained are used in compiling index numbers of the price of materials for small frame and brick houses. Current statistics on building activities, building costs,

and production, consumption and stocks on hand of the principal building materials were printed monthly in the Survey of Current Business and in Commerce Reports with the co-operation of the division. Inquiries for such statistics have come to the division from all branches of the building and material industries, appraisal companies, railways, federal, state and local government agencies, libraries and educational institutions.

Seasonal Construction

Work on seasonal operation in the construction industries included publication of a 216 page volume, a pamphlet on weather and construction, and shorter articles. Leading national organizations of building material producers, contractors, and other interests were represented on the committee of the President's Conference on Unemployment that worked with this division on the subject. These bodies as well as local groups in many cities, have co-operated in efforts to distribute building activities more evenly throughout the year, to the end that hundreds of thousands of men in the building trades and material producing industries may have steadier employment, and that traffic demands on railroads and general business conditions may be better stabilized.

The division of Simplified Practice, of which Mr. R. M. Hudson is chief, reports that recommendations accepted by the following material producers have reduced the number of varieties as indicated:

Material	Reduced varieties
	From To
Vitrified paving brick	66 4
Metal lath	125 24
Penetration asphalt	88 9
Rough face brick	39 1
Smooth face brick	36 1
Common brick	44 1

It has been proposed to reduce the varieties of sand-lime brick, as to length, from 5 to 1; as to width from 4 to 1 and as to height from 5 to 1.

DEPARTMENT OF COMMERCE WASHINGTON

RECOMMENDED PRACTICE FOR ARRANGEMENT OF BUILDING CODES

The Department of Commerce Building Code Committee has just completed, and the Department has published, a report on Recommended Practice for Arrangement of Building Codes. The Committee was appointed by Secretary of Commerce Herbert Hoover early in 1921 to draw up more economical building regulations for use by states and cities, and the present report is the fifth of a series on building codes. The report presents a recommended outline for writing a building code, arranged by chapters, sections and subdivisions in the order in

which reference is necessary to code provisions when a building is planned, designed and erected. Each chapter and section heading is followed by a brief explanation indicating the material which should be treated in a building code under the heading. It is expected that the outline not only will be useful in drafting building codes but that it will be very helpful to those designing buildings in the examination of unfamiliar codes to make sure no important requirements have been overlooked. A list of the chapter headings follows:

- Chapter 1. Administration.
- Chapter 2. Definitions.
- Chapter 3. Classifications.
- Chapter 4. General Building Restrictions.
- Chapter 5. Zoning.
- Chapter 6. Light and Ventilation.
- Chapter 7. Means of Egress.
- Chapter 8. Materials, Loads and Stresses.
- Chapter 9. Construction.
- Chapter 10. Precautions During Building Operations.
- Chapter 11. Fire Protection.
- Chapter 12. Chimneys and Heating Appliances.
- Chapter 13. Special Occupancy Provisions.
- Chapter 14. Elevators.
- Chapter 15. Plumbing.
- Chapter 16. Heating.
- Chapter 17. Electrical.
- Chapter 18. Signs and Billboards.
- Chapter 19. Fire Extinguishing Equipment.

The report discusses briefly present diversity of building code arrangement and its influence on ease of administration and use. The need for greater uniformity of arrangement is explained and the method advocated by the Committee is contrasted with others.

The Appendix deals with the relation of code requirements to the police power and gives much advice on the legal scope of code requirements. Some observations are presented on the value of a building code to a community. The report describes at length the customary methods of writing or revising codes and emphasizes the need of employing experienced consultants in such work. Directions are given for stating code requirements in a manner readily intelligible to the building public, and a strong plea is made for reduction in the number and variety of permits necessary for each building. A number of publications and information sources available to those writing or revising codes are listed in the Appendix and the best methods or printing code requirements are described.

The key-note of the report throughout is greater convenience for those planning and erecting buildings where this is consistent with the purposes of building regulation.

The report contains 30 pages and can be purchased from the Superintendent of Documents, Washington, D. C., for 10 cents.

WIND PRESSURE ON MODEL OF BUILDING DETERMINED BY BUREAU OF STANDARDS

The average wind pressure on a tall building when the wind is blowing at 76 miles per hour (100 miles per hour, as shown by a Weather Bureau, Robinson type anemometer) is about 22 pounds per square foot, according to results obtained by the Bureau of Standards, Department of Commerce. The value which is commonly used is 30 pounds per square foot. This would correspond to a true wind speed of about 88.5 miles per hour (118 miles per hour indicated speed). Gusts of this speed have only been observed in a few cities, such as New York, and St. Paul.

These results were obtained by measuring the force of the wind on a model of a tall building mounted in the large outdoor wind tunnel of the Bureau. This tunnel is 10 feet in diameter, and in these experiments winds up to 70 miles per hour were produced, values for higher speeds being obtained by extrapolation. By means of small openings in the face and top of the model which were connected to a pressure gauge, the pressures produced by the wind at various parts of the structure were measured. These measurements were made at 70 places on the face of the model and at 49 places on the top, with the wind coming from 13 directions, varying from directly against one face to directly against the opposite face. Of course, in this work the wind always comes from one direction, and the model is turned on its mounting. The pressures obtained were then multiplied by the appropriated areas to give the total force on the model under the different conditions. The forces tending to overturn and to twist the model were also computed.

This work was undertaken because of the many inquiries received by the Bureau concerning wind pressures on buildings. The same experimental methods were employed which have been found so useful in the investigation of air forces on airplanes.

It has always been recognized that in the design of engineering structures such as tall buildings, bridges, chimneys, transmission lines, radio masts, etc., it is necessary to make provision for the stresses produced by the pressure of high winds. However, the values of the forces produced by the wind used by engineers in structural design are based on experiments made a great many years ago by methods which are now known to be subject to large errors, and on models which do not resemble actual structures. Many engineers have felt that these old values

are too large, and that many structures are made stronger than is necessary, and therefore cost more than they should.

The Bureau has determined the actual pressure corresponding to a given wind velocity. There still remains the problem of determining what wind velocity to use in designing a structure. Obviously, a higher velocity ought to be assumed in designing a building facing the lake front in Chicago than for a building in the downtown section of Washington.

THE DETERIORATION OF BROWNSTONE

Brownstone has been extensively used as an ornamental stone for building purposes, particularly in connection with residences and brick mercantile buildings, and even where its cost forbade its adoption as the chief structural material, it was quite commonly employed for window ledges, and for copings, gargoyles, and other ornamental parts. The impression seemed to be that it possessed not only great strength, but also a high resistive power against the action of the elements. The term "a brownstone front" was synonymous not only with elegance, but also with stability and permanence. Recent experience, however, has shown that the durability of the stone depends in large measure upon certain points that are often overlooked.

Brownstone is a fine-grained or fine-textured sandstone, and was formed many ages ago by the continued deposition of sand by rivers and streams. This deposition took place usually in the form of successive thin layers, one laid down upon another. Then, as time went on and geologic changes took place, the mass was subjected to great heat and pressure, which cemented these layers together. As a result, the stone is stratified and has a definite grain.

In the quarrying process little attention is paid to the direction of the grain of the stone, as a rule, and in many of the pieces that are cut or sawed for building purposes the grain therefore runs in a vertical direction. Such stone is quite satisfactory for interior work, but in cutting stone for exterior use, care should be taken to have the grain run horizontally. When cut and set in such a position, brownstone is practically impervious to water and resists the deteriorating effects of the weather.

It deteriorates quite rapidly, however, when set with the grain running vertically and exposed to the weather. Rain seeps in between the layers and tends to produce disintegration, and in winter this moisture freezes and the internal pressure thus created often splits the strata apart. In the summer, the moisture also tends to absorb any sulphur gases that may be presents in the air (from burning bituminous coal or high-sulphur-content oil),

and the sulphurous acid thus formed may attack the cementing substances between the grains. Continued action of this kind often results in eventual cleavage along the lines of stratification.

An example of such action and its results was recently made on a window ledge suspected of being imperfect. After being released by light hammer taps, a section one inch thick and running the entire length of the ledge was lifted out by hand. When the condition of the window ledge was discovered a complete inspection of all the exterior brownstone trimmings on the building was made and it was found that approximately sixty per cent of the stone had been cut and set with the grain running vertically. Every stone so placed showed signs of weather effects, but the stones that were properly set, and in which the strata ran horizontally, were sound and intact. A mason was engaged to make repairs, and while he was removing from the corner of the roof a gargoyle representing a large bird, a wing weighing nearly seventy-five pounds, detached itself when merely touched by the workman. It is fortunate that these stones were noted and removed before any sections had actually fallen to the sidewalk below. Serious consequences would have been very probable indeed, because the building is located in the congested section of a good-sized city.

Every owner of buildings constructed in whole or in part of such material should have the stone periodically inspected. Stones found to be set with the grain in a vertical plane and showing signs of weathering, should be at once trimmed off or otherwise repaired, and in bad cases they should be removed and replaced by others cut in the right way. Deterioration may be readily detected by lightly tapping with a hammer, because a stone in which cleavage has begun will emit a dead sound. Sometimes a dark line running lengthwise of the stone gives evidence to the eye that cleavage is taking place. Such a line was noted in the particular case mentioned above, and the discoloration extended almost half-way through the piece downward from the top, and also a short distance upward from the under or protected side.

Stones that are not too badly affected may often be repaired by carefully removing all the loosened parts, cleaning thoroughly, roughing for anchorage (when this is necessary), and then building back to nearly the original form with a good grade of cement. The cement should entirely cover the upper face of the stone, to prevent further checking by the weather.

Coping or cap stones that are cut and set in a like manner should be replaced by properly cut stones, or by brick with tile caps.—*Associated Contractors.*

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

You Can Pour Concrete In Freezing Weather When You Use "ANTI-HYDRO"

This entire building was constructed between November and February with the aid of "ANTI-HYDRO."

"ANTI-HYDRO" lowers the freezing point of concrete and cement mixtures to 17 degrees below the freezing point of water, making it possible to continue concreting, cementing and masonry work during freezing weather, instead of shutting down the job with a loss of valuable time and costly delays.

"ANTI-HYDRO" is an easy-to-use liquid integral compound which also permanently hardens and waterproofs concrete all in one operation. It mixes readily with the gauging water without the aid of skilled labor. During 21 years of continuous use "ANTI-HYDRO" has never failed to live up to the claims made for it. Satisfactory results are guaranteed. Use it on your next job.

As The Editor Sees It

ANOTHER Xmas has come and gone and we all turn our faces expectantly and hopefully toward the New Year. What promise of success, and prosperity, and happiness, does 1926 hold forth to us?

Many years in the past have been hailed as the greatest of all years in the building industry. It is almost incomprehensible that 1925 should have exceeded all previous prosperous years in building work, and all signs point now to still greater achievement in the year about to be born.

We, in American industry, have our faults. We complain about high wages, and exorbitant prices. Yet, at heart we know we would not change these conditions, for it is because of them that the rank and file of American citizenship enjoy luxurious privileges, and living conditions such as are possible for the working class in no other country in the world.

At this time of year we are particularly impressed with the prevailing spirit to stretch out a helping hand to the fellow who is down. Everywhere, business organizations, associations and clubs are imbued with the will to do something for someone less fortunate, and we be-

lieve that this spirit holds throughout the year, as well as at Xmas.

Let us resolve to maintain this spirit of helpfulness throughout all the new year. Co-operation with our associates in business and practice of the golden rule not only at this season of the year but during the entire year will make the entire building trades happier and a more pleasant world in which to labor.

We are grateful for the co-operation of Architects, Builders and the entire Building Trades rendered during 1925 and extend a hearty wish to all that 1926 may bring continued prosperity to the Architectural and Building Trades.

"ECONOMIC PROSPECTS FOR 1926"

In response to many requests from the press Secretary Hoover made the following statement on "Economic Prospects for 1926":

Any business forecast must be simply an appraisal of the forces in motion at home and abroad, for and against progress. All signs indicate that if we will temper our optimism with a sprinkling of caution we shall continue our high level of prosperity over 1926.

The United States has produced and

consumed more goods in 1925 in proportion to population than ever before in its history. Our standard of living has therefore been the highest in our history and is of course the highest in the world. This improvement, however, has been greater in the urban centers than in agricultural communities.

The dominant favorable factor in our outlook is our increased productivity, due to fundamental and continuing forces—such as the cumulation of education, the advancement of science, skill, and elimination of waste. Other favorable indications on the immediate horizon are that the stocks of commodities are moderate; there is employment for practically everyone; real wages are at a high level; savings are the largest in history and capital is therefore abundant; and the whole machinery of production and distribution is operating at a higher degree of efficiency than ever before. While wholesale prices for the year as a whole have averaged about 6% higher than for the previous year it is largely due to needed advance in prices of agricultural products.

There are some phases of the situation which require caution. Continuation of real estate and stock speculation and its possible extension into commodities with

inevitable inflation; the over-extension of installment buying; the extortion by foreign government-fostered monopolies dominating our raw material imports; the continued economic instability of certain foreign countries; the lag in recovery of certain major agricultural products; the instability of the coal industry; the uncertainties of some important labor relationships—all these are matters of concern. But as said above, with caution we should continue a prosperous year over 1926.

Agriculture, while it is better than it was two years ago, still leaves the farmers with much accumulated debt, and generally has not gained a stability that makes for contentment because its basic economic problem of market is unsolved. Also it suffers from continued distortion in price relationship of the middle west to the competing foreign countries because our transportation costs to sea board have had to be increased more than those of its foreign competitors. The projected enlarged program of improvement in waterways is of great importance in this matter.

The construction industries have played a very large part in the high business activity of the past three years. The volume of construction has been unprecedented during the past year with consequent great activity in the construction-material industries, iron, steel, lumber, cement, etc. Contrary to normal expectations this increased demand has not increased prices, for there has been a slight reduction in building costs due in a large measure to the gradual lengthening of the building season. The increasing Federal, State, and municipal public works programs for next year together with the promise of large electrical and railway extension and improvement, indicate a continuing demand for heavy construction. While it might be thought that the war deficiency in housing has been overcome, yet the high real wage in industry creates a demand for better housing and this condition, combined

with the migration to suburbs due to the motor, promises to continue as long as employment remains general. We could hardly expect so exceptional a construction activity to repeat itself, but there will be a large volume in any event.

The textile and shoe industries as a whole are running at high levels of production, although the tendency in some branches of these industries to develop more rapidly in the South and West is affecting New England pending readjustment of her economic relationships. The automobile and tire industries will record an unprecedented output. The coal industries show increased production despite the anthracite strike and the production of all other minerals has increased.

In transportation, our railways are giving the best service in our history and are recovering in average earnings to near the Interstate Commerce Commission standard of earnings of five and three-fourths per cent. There is some improvement from the acute depression in the shipping world; and progress has been made in plans for internal waterway improvement. The electrification of the country has made further great strides during the year toward central generation and interconnection. There has been some pyramiding of power holding companies, much criticized within the electrical industry itself, but the solid progress of the industry is marked by the extension of use of electricity with all its economies in production of goods and saving of labor. Furthermore, taking the country as a whole, there has been a reduction in rates for power and light indicating that the public is securing benefits from the economies introduced in production of electricity.

Our foreign trade in 1925 has been exceptionally satisfactory. Both exports and imports have risen materially, the former reflecting an increase in agricultural exports and the latter reflecting the large demand for foreign raw materials

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

The Newest in Hot Water Heating

Have you seen the latest improvement in round house heating boilers? It is called the "Combustion Ring" (shown below) and it surrounds the firepot to a height of 41½ inches above the grates. It has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of

the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-12.

(Continued from page 820)

and tropical foodstuffs. Exports will total around \$4,900,000,000 or about 7% more than in 1924. Imports will amount to about \$4,200,000,000 or approximately 17% more than in 1924. Roughly, one half of this increase in both exports and imports is attributable to greater quantities exported, and the remainder to advance in prices. The major explanation of our favorable trade balance is, of course, to be found in the continued heavy investment of American capital abroad; in essence we are lending foreigners the where-with-all to buy goods from us, or are sending goods to convey our investments abroad. It is probable that the final figures will show that this country has added to its foreign investments during the year by more than a billion dollars.

The most remarkable thing about the foreign trade of the United States is that, after making allowance for the higher level of prices, both exports and imports are much greater than before the war, in contrast with the quantitative decrease in the trade of the other foreign countries engaged in the war. According to Brit-

ish calculations the exports of that country were in physical volume nearly 25% less in 1925 than before the war, and Germany's exports have fallen off still more. British imports are practically at their pre-war level, and those of Germany materially below it.

In finance, the year has been characterized by increased savings, comparatively easy money conditions, the issuance of a large volume of both domestic and foreign securities, and by an extraordinary rise in the prices of stocks accompanied by marked speculation on the New York Stock exchange. This fever of speculation is also wide-spread in real estate and unless our financial policies are guided with courage and wisdom, this speculation may yet reflect into the commodity markets, thereby reversing the cautious buying policies of recent years. Psychology plays a large part in business movements and over-optimism can only land us on the shores of over-depression. Not since 1920 have we required a better informed or more capable administration of credit facilities than now if we are to continue an uninterrupted high plane of prosperity. In any event there should be no abatement of caution in the placing of forward orders, particularly in view of the great increase in sales of a great variety of merchandise on the installment basis.

In the foreign field as a whole the situation is more promising than at any other time in twelve years. Each year one nation after another abroad gains in economic and fiscal stability, in production and in employment. War-inherited famines have disappeared from the earth, standards of living are everywhere higher than at any time since the war. In fact, no one in 1919 would have believed that so great a measure of recovery would be attained in Europe by 1925—a proof of a high quality in European statesmanship. The Locarno Agreement promises much greater political stability, and paves the way for another stage of disarmament with consequent improvement in the economic outlook. Of the disturbed areas England and Germany have not recovered employment in full; France shows economic strength among her people, but popular resistance has so far made it impossible to stabilize the fiscal system; China continues in the throes of civil war, but business nevertheless continues; Russia makes progress as the government slowly abandons socialism. The quantity of goods moving in international trade as a whole has recovered to the pre-war

level, although some countries are below, and fully 90% of international business is now based upon stabilized currencies.

On the whole, both our own country and the rest of the world face a more favorable outlook at this turn of the year than for a long time past. We, ourselves, however, need to be on our guard against reckless optimism. What we need is an even keel in our financial controls, and our growing national efficiency will continue us in increasing prosperity.

INTRINSIC ESSENCE OF BUSINESS

Fundamental truths which have been learned about the conduct of business during the experience of man have been set down by the United States Chamber of Commerce. They are practical guides for the individual in his personal affairs as well as ideals which should be attained by every business concern.

1. The foundation of business is confidence, which springs from integrity, fair dealing, efficient service, and mutual benefit.

2. The reward of business for service rendered is a fair profit plus a safe reserve, commensurate with risks involved and foresight exercised.

3. Equitable consideration is due in business alike to capital management, employees, and the public.

4. Knowledge—thorough and specific—and unceasing study of the facts and forces affecting a business enterprise are essential to a lasting individual success and to efficient service to the public.

5. Permanency and continuity of service are basic aims of business, that knowledge gained may be fully utilized, confidence established and efficiency increased.

6. Obligations to itself and society prompt business unceasingly to strive toward continuity of operation, bettering conditions of employment, and increasing the efficiency and opportunities to individual employees.

7. Contracts and undertakings, written or oral, are to be performed in letter and in spirit. Changed conditions do not justify their cancellation without mutual consent.

8. Representation of goods and services should be truthfully made and scrupulously fulfilled.

9. Waste in any form of capital, labor, services, materials, or natural resources is intolerable, and constant effort will be made toward its elimination.

10. Excess of every nature—the inflation of credit, over-expansion, over-buying, over-stimulation of sales—which creates artificial conditions and produces crises and depressions, is condemned.

11. Unfair competition, embracing all acts characterized by bad faith, deception, fraud, or oppression, including commercial bribery, is wasteful, despicable, and a

public wrong. Business will rely for its success on the excellence of its own service.

12. Controversy will, where possible, be adjusted by voluntary agreement or impartial arbitration.—*Associated Contractor.*

THE HAZARD OF FALLING OBJECTS ON CONSTRUCTION JOBS

The fact that even a small object may cause a serious injury in falling a comparatively short distance is specially well known to persons familiar with building construction operations, because falling objects are a prolific source of accidents in connection with work of that kind. There are necessarily many objects, both small and large, on construction jobs, which cannot be fastened in place on account of the way in which they are used; and although numerous safety measures have been recommended to prevent such things from falling, these precautionary plans are not always followed and even when they are followed they are not always wholly effective. Moreover, many of the accidents are caused by the carelessness of the workmen in handling materials and tools, and by unsafe practices of various kinds; and in order to prevent accidents of this type constant supervision, warnings, and discipline are required.

Rivets, bolts, nuts, washers, tools, and pieces of brick, tile, and concrete are some of the small objects that commonly fall and cause injuries to workmen on building construction jobs. For example: On a recent job, a bolt three inches long fell five stories, struck a man on the head and injured him so severely that he lost six weeks' time from his work. In another case an iron washer, 2½ inches in diameter, fell only two stories; but it struck a man's toe and caused an injury

which resulted in three weeks' loss of time. A wrench fell from a workman's pocket, struck a man below, and caused a wound which required hospital treatment. A cut-off end of a bolt fell eight stories, hit the floor, rebounded, and struck a man in the face. Another man nearly lost his life when a piece of concrete fell and struck his head, while he was looking down a shaftway.

These examples are all taken from one particular job, and many others of like nature happened there also. In fact such things are of common occurrence on all building operations. We have no new remedy to prescribe, for the prevention of such accidents, but we still have faith in the efficacy of safety methods and devices that have proved their value in the past. As previously suggested, these may not prevent all the accidents, but they surely do eliminate a large proportion of them; and their value will be increased by every successful effort to secure greater co-operation in safety work on the part of everybody on the job—including the executives of the contracting company.

The means and methods to be used for preventing objects and materials from falling are simple, and most of them can be put into operation with comparatively little labor or expense. For example, it is seldom necessary to pile materials and supplies close to the edges of stair wells, elevator hoistways, or ventilating shafts. It would be just as easy and convenient, and far safer, to store them well away from such openings. It is best to lay the permanent floors as soon as the construction of the other parts of the building will allow; and if temporary or permanent openings are necessary, they should be surrounded by toe-boards at least six inches high, and be provided with strong handrails also. Shaftways for hoists used in transporting workmen and materials should preferably be completely in-

A SERIOUS BUILDING PROBLEM SOLVED BY RAYNOR'S PLASTERS' SAFETY CLIPS

the Lath can not be Separated from Furring Bar

JOHN S. RAYNOR

MANUFACTURER

2300 EAST LEHIGH AVENUE, PHILADELPHIA

closed on all four sides, with entrance doors or gates at the various floor levels; and suitable covers should be provided for the hoists.

Whenever scaffolds are used in such locations that objects may fall down upon them from above, they should be roofed over with planking or with firmly secured, heavy wire netting. Railings and toe-boards should also be provided on the scaffolds themselves, to prevent men and materials from falling off. Protective platforms should be installed over doorways and passages that are commonly used by workmen, when work is going on upon scaffolds or walls above them; and all platforms or shields, of this sort should be strong enough to withstand shocks caused by the fall of fairly heavy masses of materials. The planks of which they are made should be nailed in place, and should fit together tightly. They should also bear against the wall of the building so that no space will be left between them and the wall, through which objects might pass.

The skill shown by rivet heaters and members of riveting gangs in throwing and catching hot rivets, is a matter of considerable interest. The rivets are not always caught, however, and they are likely to produce serious injuries in the form of bruises, cuts, or burns, if the catcher misses them and they strike anybody in falling. Rivet-heaters' platforms should therefore be situated as near the riveting gangs as possible, so that long-distance throwing of rivets will be unnecessary. Moreover, special care should be taken to avoid throwing the rivets in such a direction that they may pass outside the building and fall to the street. Sometimes it is practicable to install the rivet-heaters' platform above the riveting gang, and to pass the hot rivets down through a 2-inch conduit or pipe provided for this special purpose.

Users of the public streets should also be protected against injury from objects falling from buildings in course of erection. Substantially constructed sidewalk bridges are usually necessary, and these should extend along the entire frontage of the building. Occasionally, if a high building is being constructed and the street on which it faces is narrow, it is advisable to roof over the entire width of the street. On these high buildings it is also necessary to provide "catch platforms" at several different levels, to catch and retain falling objects. These should be of generous width and the outer edges should be inclosed by strong board fences, or by strong screens of close-meshed wire netting. A surprisingly large quantity of material will collect on a platform of this kind in a short time, including planks, pieces of wood of assorted sizes, lumps of mortar, nails, bolts, rivets, and fragments of brick and tile.

Falls of heavy masses, such as derrick loads and material hoists, are less common, but are usually attended by disastrous consequences. Among the causes of such accidents are overloading the hoisting equipment; the use of dangerously worn cables, slings, chains, and hooks; failure of the brakes on derricks and hoisting motors; neglect to secure derrick loads properly; poor signal work; and carelessness on the part of hoisting engineers. Frequent and thorough inspections by experts are necessary to keep hoisting apparatus in safe condition; and the inspector should have authority to order new equipment to replace any that is found to be dangerously worn or inadequate in strength for the work required of it.

The proper placing of slings about loads is of great importance and should be supervised by men who are thoroughly experienced in such work, and who understand its dangers.

Building construction differs from most other kinds of work in that the conditions change daily, or even hourly, with the progress of the work. For this reason constant watch must be kept for the new hazards that are continually developing, and which should be safeguarded as soon as they become apparent. —*The Travelers Standard.*

SIMPLE UNDERPINNING WITH CAST-IN-PLACE CONCRETE PILES

Usually underpinning a wall or foundation is a costly operation, involving shoring and the danger of settlement and damage, especially if the new foundations have to be carried to a great depth or are in wet or treacherous soil.

Many of the difficulties can often be avoided by a method that has been used for several years, chiefly in New York, whereby concrete piles may be formed under the center line of the wall and carried down, if necessary, to great depths without entering the building, without the use of needle beams or shoring, and without, at any time, impairing the original stability of the structure, but rather improving it. This method, invented by Mr. Jules Breuchaud, was very successfully used by the Underpinning and Foundation Company, New York, to prevent the possibility of the settlement of the walls of a 3-story and basement building adjacent to the site of the Evening Post Building on West Street, where they were sinking a large number of pneumatic caissons, some of them very close to this building, through wet sand and fill more than forty feet below the surface. Before the caisson excavation was commenced the weight of the entire wall was transmitted to the underlying hardpan stratum by a small gang with simple equipment who did not even enter the building.

For each pile a 6 by 10 foot access pit was sunk to the bottom of the wall footing and protected by hand-driven wooden sheet piles. From the bottom of this pit a 4 by 4 foot jacking pit extending under the full width of the wall was sunk to a depth of about seven feet, except in places where it was necessary to go deeper to remove timber and other obstructions encountered in the filled ground. Although only a few hundred feet from the North River, the ground to the bottom of the pit could be kept dry by a moderate amount of pumping. In the bottom of each jacking pit was set a vertical four-foot length of 15-inch steel pipe with a 100 ton Watson-Stillman hydraulic jack on it wedged to bearing against the lower surface of the wall footing.

The jack was operated by hand to drive the pile into the ground while the earth in the interior of it was occasionally removed by a very small orange-peel bucket operated by hand. When the top of the pile was driven down to the bottom of the pit, a second 4 to 6-foot section of the pipe was connected to it with an inside sleeve and the jacking and sinking resumed until the pipe brought up against the hardpan stratum or developed a resistance of more than eighty tons as indicated by the pressure gauge.

After being driven to the required depth the pipe was cleaned out by the Hayward Bucket and was then ready to serve as a shell or form for the concrete pile. It was promptly filled with a mixture of 1 to 2 to 4 Atlas Portland Cement concrete and a bulkhead having been built across the center line of the jacking pit to retain it, the concrete was also filled in around the top of the pile and above it to within about three or four inches of the wall footing.

When the concrete was set there was placed over the top of the pile a pair of 16 by 22 by 1 inch steel bearing plates separated by half a dozen pairs of thin folding steel wedges. The lower wedges were placed with their thin ends at the front of the wall and their thick ends bearing against a wooden stop to prevent them from being displaced when the upper wedges, having their thick ends projecting beyond the face of the wall, were driven to good bearing.

The front part of the access pit was then back-filled to within two feet of the top and the upper part of the bulkhead form removed, leaving the wedges accessible for adjustment if necessary, as

the other piles were driven in a similar manner. Eventually the spaces between and around the wedges and wedging plates will be sealed with grout and the upper portion of the access pit will be filled with concrete forming a continuous construction.

This method has been found very efficient and convenient for placing concrete piles or piers up to four feet in diameter, supporting extremely heavy walls of very tall buildings. If necessary, the pipes can be made large enough for men to enter and do the excavation work and examine and test the bottom, and they can be operated with pneumatic pressure and an air lock, for large sizes, to facilitate work in quicksand or very wet soil.

—Contractors' Atlas.

TEN RULES FOR CHIMNEY CONSTRUCTION*

1. Build all chimneys from the ground up. None of the weight should be carried by anything except their proper foundations. Foundations should be at least twelve inches wider all around than the area of the chimney and be started well below the frost line.

2. Build all chimneys to a point at least three feet above flat roofs, and two feet above the ridge of peak roofs.

3. Chimney walls must be at least four inches thick. A suitable flue lining of fire clay should always be provided therein. For the best results, however, no chimney wall should be less than eight inches (two courses of brick) in thickness, and cement mortar only should be used. (Where chimneys are at least eight inches thick, and a refractory clay brick is used, the flue lining may be omitted.)

4. The walls of brick buildings may form part of chimney if the walls of the chimney are securely bonded to the walls of the building and the flue is lined the same as for an independent chimney. In no case should a chimney or flue be corbelled out more than six inches from the wall, and in all cases the corbeling should consist of at least five courses of brick. Flues in party walls should not extend beyond the center of said walls, and their presence should be permanently indicated on both sides of walls.

5. Build all chimneys large enough to give a separate flue for each fire, using

*This information is extracted from a circular issued by the National Fire Protection Association.

fire clay tile at least three-quarters of an inch in thickness. This is to prevent disintegration of mortar and brick. Such linings also make a smooth flue, which greatly improves the draft.

6. Do not run floor joists or other woodwork into chimneys or flues, nor allow wood casing, lathing or furring within two inches of chimney breasts.

7. All floor timbers should be "trimmed" clear of the hearths and brickwork of the chimney, so as not to be in contact with it at any point.

8. Line fireplaces with fire brick or cast iron. If ash pits are provided, do not pile wood or rubbish against their doors in basement. Keep free space around them so that ashes can be readily removed and also that coals cannot possibly come in contact with combustible material.

9. Be careful of joints between stovepipes and flues, and use thimbles and connections in accordance with specifications and ordinances. If a stovepipe is taken down to be cleaned, be sure that it is replaced and safely plastered in position.

10. After removing a stovepipe from a chimney, close the opening with a metal flue stop; if the flue connection is left open fire may communicate, and if it is closed by being stuffed full of rags or paper the chances are that it will communicate.

OHIO UNIVERSITY TO STUDY BUILDING INDUSTRY

Bureau of Business Research of Ohio State "U" to Make Comprehensive Survey

A study of the construction industry in all its phases is to be made by the Bureau of Business Research of Ohio State University which will follow the outline submitted by R. J. Watkins, of the Ohio State Association of Builders' Exchanges.

Mr. Watkins is also conducting two separate surveys himself, one covering weather and construction and the other employment of building mechanics in Ohio cities. In addition, he is conducting a preliminary survey relative to computing cost of construction index for the state of Ohio.

The following is a tentative outline which the Bureau of Business Research will use in the study of the construction industry:

1. The importance of the construction industry and the great influence which it has on the business structure as a whole warrant a comprehensive study of this industry.

a. It is estimated that from 8 to 12 per cent of the national income is spent in construction.

b. Approximately two and one-half million workers are employed in the construction industry, not to mention the hands of those workers in industries which are directly related to the construction industry, such as saw mills, wood-

working establishments, cement plants, iron and steel plants, brick and tile plants, stone quarries, etc.

c. The total value of construction in the United States in 1924 is estimated at approximately six billion dollars.

d. The construction industry has been termed by Secretary Hoover "the balance wheel of American industry" and the Department of Commerce further states that "the construction industry has served as a remarkable stabilizing and stimulating factor for business as a whole since 1921."

e. Almost all of the economic services in the country are of the opinion that the boom in the construction industry since 1921 has been primarily responsible for the continuance of prosperous conditions in business as a whole.

2. Complete statistical analysis of construction data for Ohio and its principal cities.

3. Determination of the effect of the weather on construction in Ohio.

4. Determination for each important city of Ohio on monthly indices of employment in each important building trade.

5. A study of the possibility of making correlation studies in order to show the value of construction statistics as barometers of business in general.

Tests recently conducted at the University of Wisconsin, under the direction of the Engineering Society of that state, demonstrated that lime-cement mortars are most satisfactory for use in cold weather. Eight lime and portland cement mixes and four bricklayers cements were tested under air storage conditions which approximate ordinary field construction curing conditions.

Mortar mixed in the proportion of 1 part of portland cement, 2 parts of lime, and 9 parts of sand by volume gave uniform satisfaction under both warm and cold storage conditions and had a high rating in shear, tensile and compressive strength. The high plasticity of this mix also played an important role in its selection as first on the list of mortars recommended by the committee.

The conclusions drawn by the committee in charge of this work are:

1. With all cements save one, freezing decreased the bond strength of the mortar to the brick. In most cases this decrease was very marked. In the exceptional case, where there was no apparent injury due to freezing the bond strength after curing in warm or freezing temperatures was very low.

2. Curing at low temperatures just above the freezing point of water adversely affected the bond strength to a less extent than during under freezing temperatures.

3. Basing judgment on the unit stress at flaking of mortar, it appears that curing at temperatures near the freezing point had little effect on the crushing strength of the mortar in the bonded brick. On the other hand, freezing appears to have had a weakening effect on the crushing strength.

4. From the above evidence it appears that freezing is detrimental to the strength of mortars which are commonly used in bricklaying.

5. From the standpoint of strength the following mortars gave the best results:

1 vol. Port. cement to 2 vol. hyd. lime to 9 vol. sand.

1 vol. Port. cement to 1 vol. hyd. lime to 6 vol. sand.

2 vol. Port. cement to 1 vol. hyd. lime to 9 vol. sand.

1 vol. Port. cement to 2.3 vol. Q. lime paste to 6.7 vol. sand.

1 vol. Port. cement to 2.3 vol. Q. lime paste to 10 vol. sand.

1 vol. Port. cement to 1.5 vol. Q. lime paste to 5 vol. sand.

1 vol. Port. cement to 1.5 vol. Q. Lime paste to 7.5 vol. sand.

1 vol. Port. cement to 3 vol. of sand.

Of these mixes those containing 1 volume of cement to 2 volumes of lime (hydrated or paste) to 9 volumes of sand are the most economical. Mixes containing equal volumes of cement and hydrate (or paste) though somewhat more costly were stronger especially at one month.

6. Mixtures of lime and Portland cement were much more plastic and easier to work than the mortar made with Portland cement and sand. The mixtures containing equal parts of hydrated lime and Portland cement and one part hydrated lime to two parts Portland cement exhibited considerably higher adhesion to the brick than the Portland cement mortar.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

Men are walking by and around people that want to buy from them, and do not know it.

The DAILY BUILDING NEWS will tell you who wants to buy your products.

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

write practically every form of insurance except life

"Don't let freezing weather stop your concrete work—use 'ANTI-HYDRO' and keep right on!"

"ANTI-HYDRO" lowers the freezing point of concrete to 15 degrees F. so that work can continue even though the thermometer goes way down. At the same time, "ANTI-HYDRO" permanently hardens and waterproofs concrete mixtures in one operation. Being a liquid integral compound, it mixes easily with the gauging water without the aid of skilled labor.

The concrete work on this building continued right on through the freezing weather. Much valuable time was saved and results were entirely satisfactory.

For 21 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Use it also for cold weather work. It will save you time and money. Write for specifications.
